GTU PAPERS
UNIT-1 » VECTOR CALCULUS

- SCALAR POTENTIAL FUNCTION OF VECTOR FUNCTION:
  - The gradient of a scalar function \( f(x,y,z) \) is denoted by \( \text{grad } f \) or \( \nabla f \) and is defined as:
    \[
    \text{grad } f = \nabla f = \left( \frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z} \right)
    \]
  - For a vector function \( \vec{F} \), \( \vec{F} = \nabla f \) or \( \vec{F} = \text{grad}(f) \) then \( f \) is called scalar potential of \( \vec{F} \).

- PROCEDURE TO FIND SCALAR POTENTIAL FUNCTION OF A VECTOR FUNCTION:
  - If \( \vec{F} = (f_1(x,y,z), f_2(x,y,z), f_3(x,y,z)) \) or \( f_1(x,y,z) \hat{i} + f_2(x,y,z) \hat{j} + f_3(x,y,z) \hat{k} \) is given.
    1. Find \( A = \int f_1(x,y,z) \, dx \), \( B = \int f_2(x,y,z) \, dy \), \( C = \int f_3(x,y,z) \, dz \).
    2. Write \( f \) as \( f = A + B + C \) without repeating the terms.

METHOD – 1: EXAMPLES OF SCALAR POTENTIAL FUNCTION

| H  | 1 | Find the scalar potential function \( f \) for \( \vec{B} = (2x, 4y, 8z) \).
|    |    | **Answer:** \( x^2 + 2y^2 + 4z^2 + c \). |

| H  | 2 | Find the scalar potential function \( f \) for \( \vec{A} = y^2 \hat{i} + 2xy \hat{j} - z^2 \hat{k} \).
|    |    | **Answer:** \( xy^2 - \frac{z^3}{3} + c \). |

| T  | 3 | Find the scalar potential function for \( \vec{C} = \left( \frac{y}{z}, \frac{x}{z}, -\frac{xy}{z^2} \right) \).
|    |    | **Answer:** \( \frac{xy}{z} + c \). |

| C  | 4 | A vector field is given by \( \vec{F} = (x^2 + xy^2) \hat{i} + (y^2 + x^2y) \hat{j} \). Find the scalar potential.
|    |    | **Answer:** \( \frac{x^3}{3} + \frac{y^3}{3} + \frac{x^2y^2}{2} + c \). |
**DIVERGENCE OF A VECTOR FUNCTION:**

- The divergence of the vector function \( \vec{F} = (f_1, f_2, f_3) = f_1 \hat{i} + f_2 \hat{j} + f_3 \hat{k} \) is denoted by \( \text{div} \vec{F} \) and is defined as:

\[
\text{div} \vec{F} = \nabla \cdot \vec{F} = \frac{\partial f_1}{\partial x} + \frac{\partial f_2}{\partial y} + \frac{\partial f_3}{\partial z}
\]

- The divergence of a vector function is a scalar.

- A vector function \( \vec{F} \) is said to be solenoidal or incompressible or solenoidal field if \( \text{div} \vec{F} = 0 \).

- Result:

\[
\text{Div}(\text{grad} \, f) = \nabla \cdot (\nabla f) = \nabla^2 \cdot f = \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} + \frac{\partial^2 f}{\partial z^2}.
\]

**METHOD – 2: EXAMPLES OF DIVERGENCE OF A VECTOR FUNCTION**

| H | 1 | Find divergence of the vector function \( \vec{V} = 3x^2 \hat{i} + 5xy^2 \hat{j} + xyz^3 \hat{k} \) at the point \((1, 2, 3)\). | Answer: 80. |
| 2 | If \( \vec{A} = x^2z \hat{i} - 2y^3z^2 \hat{j} + xy^2z \hat{k} \), find \( \nabla \cdot \vec{A} \) at the point \((1, -1, 1)\). | Answer: \(-3\). |
| H | 3 | If \( \vec{F} = \text{grad}(x^3 + y^3 + z^3 - 3xyz) \), find \( \text{div} \vec{F} \). | Answer: 6(x + y + z). |
| C | 4 | If \( \phi = xyz - 2y^2z + x^2z^2 \), find \( \text{div} \, (\text{grad} \phi) \) at the point \((2, 4, 1)\). | Answer: 6. |
| C | 5 | Let \( \vec{r} = x \hat{i} + y \hat{j} + z \hat{k} \), \( r = |\vec{r}| \), and \( \vec{a} \) is a constant vector. Find the value of \( \text{div} \left( \frac{\vec{a} \times \vec{r}}{r^n} \right) \). | \( \text{W} 2019 \) (7) |
| C | 6 | Determine whether the vector field \( \vec{U} = y^2 \hat{i} + 2xy \hat{j} - z^2 \hat{k} \) is solenoidal at a point \((1, 2, 1)\). | Answer: Solenoidal. |
7. Prove that \( \mathbf{F} = \frac{x\mathbf{i} + y\mathbf{j}}{x^2 + y^2} \) is solenoidal at any point.

8. Find the value of ‘m’ so that the vector \( \mathbf{V} = (x + 3y)\mathbf{i} + (y - 2z)\mathbf{j} + (x + mz)\mathbf{k} \) is solenoidal.

**Answer:** \( m = -2 \).

**Curl of Vector Function:**

- The curl of the vector function \( \mathbf{F} = (f_1, f_2, f_3) = f_1\mathbf{i} + f_2\mathbf{j} + f_3\mathbf{k} \) is denoted by \( \text{curl} \mathbf{F} \) and is defined as:

\[
\text{curl} \mathbf{F} = \nabla \times \mathbf{F} = \begin{vmatrix}
\mathbf{i} & \mathbf{j} & \mathbf{k} \\
\frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\
f_1 & f_2 & f_3
\end{vmatrix}
\]

- The curl of a vector function is a vector.
- \( \text{Curl}(\text{grad} f) = \mathbf{0} \) i.e. \( \nabla \times (\nabla f) = \mathbf{0} \).
- \( \text{Div}(\text{curl} \mathbf{F}) = 0 \) i.e. \( \nabla \cdot (\nabla \times \mathbf{F}) = 0 \).

**Conservative Fields:**

- Let \( \mathbf{F} \) be a vector field defined on an open region \( D \) in space and suppose that for any two points \( A \) and \( B \) in \( D \) the line integral \( \int_C \mathbf{F} \cdot dr \) is path independent in \( D \) then the field \( \mathbf{F} \) is called conservative field on \( D \).
- A vector function \( \mathbf{F} \) is said to be irrotational / irrotational field / conservative field if \( \text{curl} \mathbf{F} = \mathbf{0} \).

**Component Test for Conservative Fields:**

- Let \( \mathbf{F} = M(x, y, z)\mathbf{i} + N(x, y, z)\mathbf{j} + P(x, y, z)\mathbf{k} \) be a field on an open simply connected domain whose component functions have continuous first partial derivatives. Then \( \mathbf{F} \) is conservative if and only if

\[
\frac{\partial P}{\partial y} = \frac{\partial N}{\partial z}, \quad \frac{\partial M}{\partial z} = \frac{\partial P}{\partial x}, \quad \frac{\partial N}{\partial x} = \frac{\partial M}{\partial y}
\]
For a conservative function \( \mathbf{F} \), there exists a scalar function \( f \) such that \( \mathbf{F} = \nabla f \), where \( \mathbf{F} \) is called conservative vector field.

**METHOD – 3: EXAMPLES OF CURL OF VECTOR FUNCTION**

<table>
<thead>
<tr>
<th>H</th>
<th>Obtain curl ( \mathbf{F} ) at the point ( (2, 0, 3) ) if ( \mathbf{F} = ze^{2xy} \mathbf{i} + 2xy \cos y \mathbf{j} + (x + 2y) \mathbf{k} ).</th>

<tr>
<td>C</td>
<td>Find the value of ‘a’ if the vector ( (ax^2y + yz) \mathbf{i} + (xy^2 - xz^2) \mathbf{j} + (2xyz - 2x^2y^2) \mathbf{k} ) has zero divergence. Find the curl of this vector when it has zero divergence.</td>
</tr>
<tr>
<td>H</td>
<td>Show that the vector field ( \mathbf{F} = (ysinz - sinx) \mathbf{i} + (x \sin z + 2yz) \mathbf{j} + (xy \cos z + y^2) \mathbf{k} ) is conservative and find the corresponding scalar potential.</td>
</tr>
<tr>
<td>T</td>
<td>What do you mean by an irrotational vector field? Show that ( \mathbf{F} = (e^x \cos y + yz, xz - e^x \sin y, xy + z) ) is conservative and find a potential function for it.</td>
</tr>
<tr>
<td>C</td>
<td>Check whether the vector field ( \mathbf{F} = (e^{y+2z}) \mathbf{i} + (x \ e^{y+2z}) \mathbf{j} + (2x e^{y+2z}) \mathbf{k} ) is conservative or not. If yes, find the scalar potential function ( \phi(x, y, z) ) such that ( \mathbf{F} = \text{grad} \phi ).</td>
</tr>
</tbody>
</table>

**Answer:**

- **(2, 0, -12).**
- **\( \mathbf{0}, \text{yes.} \)**
- **\( \mathbf{0}. \)**
- **\( -2yz \mathbf{i} + (xy - z^2) \mathbf{j} + (6xy - yz) \mathbf{k}. \)**
- **\( a = -2, (4xz - 4x^2y, 4xy^2 - 2yz + y, 2x^2 + y^2 - z^2 - z). \)**
- **\( f = xy \sin z + \cos x + y^2z + c. \)**
- **\( e^x \cos y + yz + \frac{z^2}{2} + C. \)**
- **Yes, \( x \ e^{y+2z} + c. \)**
| H | 9 | A vector field is given by \( \vec{F} = (x^2 + xy^2) \hat{i} + (y^2 + x^2y) \hat{j} \). Show that \( \vec{F} \) is irrotational and find its scalar potential.  
**Answer:** \( \frac{x^3}{3} + \frac{y^3}{3} + \frac{x^2y^2}{2} + c \). |
| C | 10 | Find constants \( a, b, c \) so that \( \vec{V} = (x + 2y + az) \hat{i} + (bx - 3y - z) \hat{j} + (4x + cy + 2z) \hat{k} \) is irrotational.  
**Answer:** \( a = 4, b = 2, c = -1 \). |
| H | 11 | Show that \( \vec{F} = (y^2 - z^2 + 3yz - 2x) \hat{i} + (3xz + 2xy) \hat{j} + (3xy - 2xz + 2z) \hat{k} \) is both solenoidal and irrotational. |
| H | 12 | Show that \( \vec{A} = (3x^2y) \hat{i} + (x^3 - 2yz^2) \hat{j} + (z^2 - 2y^2z) \hat{k} \) is irrotational but not solenoidal. |
| C | 13 | Show that \( r^n \vec{r} \) is an irrotational vector for any value of \( n \) but is solenoidal only if \( n = -3 \), where \( \vec{r} = x \hat{i} + y \hat{j} + z \hat{k} \), \( r = |\vec{r}| \). |
| T | 14 | Prove in usual notation \( \nabla \times (\nabla \phi) = \vec{0} \) and \( \nabla \cdot (\nabla \times \vec{A}) = 0 \). |

**Exact Differential Form:**

- Any expression \( M(x, y, z)dx + N(x, y, z)dy + P(x, y, z)dz \) is called a differential form.

- A differential form is exact on a domain \( D \) in a space & for some scalar function \( f \) if
  \[
  Mdx + Ndy + Pdz = \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy + \frac{\partial f}{\partial z} dz = df.
  \]

  - If \( Mdx + Ndy + Pdz = df \) on \( D \), then \( F = Mi + Nj + Pk \) is the gradient field of \( f \) on \( D \).

  - Conversely, if \( F = \nabla f \), then the form \( Mdx + Ndy + Pdz \) is exact.

**Component Test for Exactness of \( Mdx + Ndy + Pdz \):**

- The differential form \( Mdx + Ndy + Pdz \) is exact on an open simply connected domain if and only if
  \[
  \frac{\partial P}{\partial y} = \frac{\partial N}{\partial z}, \quad \frac{\partial M}{\partial z} = \frac{\partial P}{\partial x}, \quad \frac{\partial N}{\partial x} = \frac{\partial M}{\partial y}.
  \]

  - This is equivalent to saying that the field \( F = Mi + Nj + Pk \) is conservative.

PARAMETRIZATION OF CURVES:

- Parametrization of the curve C in the space can be represented by a vector function $\mathbf{r}(t) = (x(t), y(t))$, where $x$ and $y$ are Cartesian coordinates and $t \in \mathbb{R}$ is called parameter.

<table>

</tbody>
</table>

**ARC LENGTH OF CURVE IN SPACE:**

- The position vector of the curve \( \mathbf{C} \) in space at any point \( t \) is denoted by \( \mathbf{r}(t) = (x(t), y(t), z(t)) \). The arc length of curve \( \mathbf{C} \) from \( a \) to \( b \) is defined as:

  \[
  L = \int_{a}^{b} | \mathbf{r}'(t) | \, dt = \int_{a}^{b} \sqrt{\mathbf{r}'(t) \cdot \mathbf{r}'(t)} \, dt.
  \]

- Consider the parameterization of the curve \( \mathbf{C} \) as \( \mathbf{r}(t) = (x(t), y(t), z(t)) \) then the arc length of \( \mathbf{C} \) from \( a \) to \( b \) can be expressed in the component from as:
\[ L = s(t) = \int_a^b \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2 + \left(\frac{dz}{dt}\right)^2} \, dt = \int_a^b \sqrt{\left(x'(t)\right)^2 + \left(y'(t)\right)^2 + \left(z'(t)\right)^2} \, dt. \]

✓ Consider the curve \( y = f(x) \), the arc length from \( x = a \) to \( x = b \) can be expressed as

\[ L = s(t) = \int_a^b \sqrt{1 + \left(\frac{dy}{dx}\right)^2} \, dx. \]

✓ Consider the curve \( r = f(\theta) \) then the arc length of curve \( r \) from \( \theta = \theta_1 \) to \( \theta = \theta_2 \) can be expressed as:

\[ L = s(t) = \int_{\theta_1}^{\theta_2} \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} \, d\theta. \]

**METHOD – 6: EXAMPLES OF ARC LENGTH**

</table>
**SOME PRELIMINARY CONCEPTS:**

- **Suppose** C is a curve parametrized by \( x = f(t), y = g(t), a \leq t \leq b \), A and B are the points \( (f(a), g(a)) \) and \( (f(b), g(b)) \) respectively.

  (1). **Smooth curve**: C is a smooth curve, if \( f' \) and \( g' \) are continuous on the closed interval \([a, b]\) and not simultaneously zero on the open interval \((a, b)\).

  ![Smooth Curve](image)

  (2). **Piecewise smooth curve**: C is piecewise smooth, if it consists of a finite number of smooth curves \( C_1, C_2, \ldots, C_n \) joined end to end; i.e. \( C = C_1 \cup C_2 \cup \ldots \cup C_n \).
(3). **Connected domain**: A domain D is connected, if we can connect any two points in the region with a path that lies completely in D.

(4). **Simply connected domain**: A domain D is simply connected, if it is connected and it contains no holes.

**PARAMETRIC EQUATION IN 3D**:

- Parametric equation of line passing through the points \((a, b, c)\) and \((x, y, z)\) is given by
  \[
  \vec{r} = \langle a + t(x - a), \quad b + t(y - b), \quad c + t(z - c) \rangle
  \]

**LINE INTEGRALS**:

- Any integral which is to be evaluated along a curve is called a line integral.
- Let \(\vec{F}(\vec{r}) = (f_1, f_2, f_3)\) be a vector function defined at every point of a curve C. If \(\vec{r} = (x, y, z)\) is the position vector of a point \(P(x, y, z)\) on the curve C and then the line integral of \(\vec{F}(\vec{r})\) over a C is defined by
  \[
  \int_C \{ \vec{F}(\vec{r}) \} \, d\vec{r} = \int_C \{ f_1 \, dx + f_2 \, dy + f_3 \, dz \}.
  \]
✓ If the curve C is represented by a parametric representation \( \mathbf{r}(t) = (x(t), y(t), z(t)) \) then line integral along the curve C from \( t = a \) to \( t = b \) is
\[
\int_{a}^{b} \{ F(\mathbf{r}) \} \, d\mathbf{r} = \int_{a}^{b} \left\{ \frac{dx}{dt} + \frac{dy}{dt} + \frac{dz}{dt} \right\} \, dt.
\]

✓ If C is a closed curve then the line integral is denoted by \( \oint_{C} \{ F(\mathbf{r}) \} \, d\mathbf{r} \).

VECTOR FIELDS AND APPLICATIONS AS WORK:

✓ If \( \mathbf{F} \) is force acting on a particle moving along the arc AB of curve C, then the line integral \( \int_{A}^{B} \{ \mathbf{F} \} \, d\mathbf{r} \) represents the work done in displacing the particle from the point A to B.

CIRCULATION AND FLUX:

✓ Flow and Circulation: Consider smooth curve \( \mathbf{r}(t) = (x(t), y(t), z(t)) \) in the domain of continuous velocity field \( \mathbf{F}(\mathbf{r}) = (F_1, F_2, F_3) \). The flow along the curve from \( t = a \) to \( t = b \) is defined as:
\[
\int_{a}^{b} \{ F(\mathbf{r}) \} \, d\mathbf{r} = \int_{a}^{b} \left\{ \frac{dx}{dt} + \frac{dy}{dt} + \frac{dz}{dt} \right\} \, dt.
\]

✓ The flow integral along the closed curve is called circulation around the curve.

✓ Flux: Let C is the smooth closed curve in the domain of a continuous vector field \( \mathbf{F} = M(x, y) \hat{i} + N(x, y) \hat{j} \) in the plane. Consider \( \mathbf{n} \) as the outward pointing unit normal vector on C. Then the line integral over C of \( \mathbf{F} \cdot \mathbf{n} \) gives the rate at which a fluid is entering or leaving a region enclosed by C. Thus the flux of \( \mathbf{F} \) across C is
\[
\int_{C} \mathbf{F} \cdot \mathbf{n} \, ds, \text{ Where } \mathbf{n} = \frac{dy}{ds} \hat{i} - \frac{dx}{ds} \hat{j}, \text{ then } \mathbf{F} \cdot \mathbf{n} = M(x, y) \frac{dy}{ds} - N(x, y) \frac{dx}{ds} \text{ i.e. }
\]
\[
\int_{C} \mathbf{F} \cdot \mathbf{n} \, ds = \oint_{C} (M \, dy - N \, dx).
\]
LINE INTEGRALS INDEPENDENT OF PATH:

- The line integral \( \int_C \mathbf{F} \cdot d\mathbf{r} \) is independent of path, if \( \int_{C_1} \mathbf{F} \cdot d\mathbf{r} = \int_{C_2} \mathbf{F} \cdot d\mathbf{r} \) for any two paths \( C_1 \) and \( C_2 \) in some domain \( D \) with the same initial and terminal points.

- The necessary and sufficient condition that \( \int_A^B \{ \mathbf{F} \} \) \( d\mathbf{r} \) be independent of path is the \( \text{curl} \ \mathbf{F} = \mathbf{0} \).

- In short, if \( \mathbf{F} \) is the gradient of some scalar potential function \( \phi \), \( [\text{grad} \ \phi = \mathbf{F}] \) then \( \int_A^B \{ \mathbf{F} \} \) \( d\mathbf{r} \) be independent of path and \( \int_A^B \{ \mathbf{F} \} = \phi(B) - \phi(A) \).

- If \( \oint_C \{ \mathbf{F} \} \) \( d\mathbf{r} = 0 \) then \( \mathbf{F} \) is conservative (irrotational).

- Integrals in the differential form are evaluated as bellow if it is of independent of path.

\[
\int_A^B \left\{ M \, dx + N \, dy + P \, dz \right\} = \int_A^B \left\{ \frac{\partial \phi}{\partial x} \, dx + \frac{\partial \phi}{\partial y} \, dy + \frac{\partial \phi}{\partial z} \, dz \right\} = \phi(B) - \phi(A).
\]

Where \( \phi \) is scalar potential function.

</table>
| C 12     | Find the work done when a force $\mathbf{F} = (x^2 - y^2 + 2x) \mathbf{i} - (2xy + y) \mathbf{j}$ moves a particle in the XY-plane from $(0, 0)$ to $(1, 1)$ along the parabola $y^2 = x$. Is the work done different when the path is the straight line $y = x$.  
Answer: $\frac{-1}{6}$, no. |
| H 13     | Find the work done by the force $\mathbf{F} = (3x^2 - 3x) \mathbf{i} + 3z \mathbf{j} + \mathbf{k}$ along the straight line $(t, t, t), 0 \leq t \leq 1$.  
Answer: 2. |
| C 14     | Find work done in moving a particle from $(1, 0, 1)$ to $(2, 1, 2)$ along the straight line $AB$ in the force field $F = x^2 \mathbf{i} + (x - y) \mathbf{j} + (y + z) \mathbf{k}$.  
Answer: $\frac{16}{3}$. |
| T 15     | Let $\mathbf{F} = 2xyz \mathbf{i} + (x^2z + 2y) \mathbf{j} + yx^2 \mathbf{k}$. If $\mathbf{F}$ is conservative, find its scalar potential $\phi$. Find the work done in moving a particle under force field from $(0, 1, 1)$ to $(1, 2, 0)$.  
Answer: $1. \phi = x^2yz + y^2 + c, 2. 3.$ |
| H 16     | Let $\mathbf{F} = (x^2 - yz) \mathbf{i} + (y^2 - zx) \mathbf{j} + (z^2 - xy) \mathbf{k}$. If $\mathbf{F}$ is conservative, find its scalar potential $\phi$. Find the work done in moving a particle under force field from $(1, 1, 0)$ to $(2, 0, 1)$.  
Answer: $1. \phi = \frac{x^3}{3} - xyz + \frac{y^3}{3} + \frac{z^3}{3} + c, 2. \frac{7}{3}$. |
| H 17     | Find the circulation of the field $\mathbf{F} = (x - y) \mathbf{i} + y \mathbf{j} + z \mathbf{k}$ around the closed curve $\mathbf{r}(t) = (\cos t) \mathbf{i} + (\sin t) \mathbf{j}, 0 \leq t \leq 2\pi$.  
Answer: $\pi$. |
| C 18     | If $\mathbf{F} = (2x - y - 2z) \mathbf{i} + (x + y - z^2) \mathbf{j} + (3x - 2y + 4z) \mathbf{k}$, calculate the circulation of $\mathbf{F}$ along the circle in the xy-plane of 3 unit radius and Centre at the origin.  
Answer: $18\pi$. |
| T | 19 | Find the flux of the field \( \mathbf{F} = x^2 \mathbf{i} + y \mathbf{j} \) around and across the closed curve \( \mathbf{r}(t) = (\cos t) \mathbf{i} + (\sin t) \mathbf{j}, 0 \leq t \leq 2\pi \).  
**Answer:** \( \pi \). |
|---|---|---|
| C | 20 | Find the flux of \( \mathbf{F} = 3xy \mathbf{i} + (x - y) \mathbf{j} \) through the parabolic arc \( y = x^2 \) between \((-1, 1) \) and \((4, 16)\).  
**Answer:** \( \frac{7465}{6} \). |
| T | 21 | \[\int_{(1,2)}^{(3,4)} (xy^2 + y^3)dx + (x^2y + 3xy^2)dy \] is independent of path joining the points \((1, 2) \) and \((3, 4)\). Hence, evaluate the integral.  
**Answer:** 254. |
| C | 22 | If \( \mathbf{F} = (2xy + z^2) \mathbf{i} + x^2 \mathbf{j} + 3xz^2 \mathbf{k} \). Show that \( \int_{C} \mathbf{F} \cdot d\mathbf{r} \) is independent of path integration. Hence find the integral when \( C \) is any path joining \((1, -2, 1)\) to \((3, 1, 4)\).  
**Answer:** 202. |

**FUNDAMENTAL THEOREM OF LINE INTEGRALS:**

- Let \( C \) be a smooth curve joining the point \( A \) to the point \( B \) in the plane or in space and parametrized by \( r(t) \). Let \( f \) be a differentiable function with a continuous gradient vector \( \mathbf{F} = \nabla f \) on a domain containing \( C \). Then

\[
\int_{C} \mathbf{F} \cdot d\mathbf{r} = f[B] - f[A].
\]

**METHOD – 8: EXAMPLES ON FUNDAMENTAL THEOREM OF LINE INTEGRALS**

| T | 1 | Find the work done by the conservative field \( \mathbf{F} = yz \mathbf{i} + xz \mathbf{j} + xy \mathbf{k} = \nabla f \), where \( f(x, y, z) = xyz \), along any smooth curve \( C \) joining the point \( A(-1, 3, 9) \) to \( B(1, 6, -4) \).  
**Answer:** 3. |
Suppose the force field \( F = \nabla f \) is the gradient of the function \( f(x, y, z) = -\frac{1}{x^2+y^2+z^2} \). Find the work done by \( F \) in moving an object along a smooth curve \( C \) joining \((1, 0, 0)\) to \((0, 0, 2)\) that does not pass through the origin.

**Answer:** \( \frac{3}{4} \)

**Green's Theorem:**

- If \( M(x, y) \) & \( N(x, y) \) and their partial derivatives \( \frac{\partial M}{\partial y} \) & \( \frac{\partial N}{\partial x} \) are continuous in region \( R \) of \( XY \)-plane bounded by a closed curve \( C \) then

\[
\oint_C (M \, dx + N \, dy) = \iint_R \left( \frac{\partial N}{\partial x} - \frac{\partial M}{\partial y} \right) \, dx \, dy.
\]

- Green's theorem is useful for changing a line integral around a closed curve \( C \) into a double integral over the region \( R \) enclosed by \( C \).

- Let 'A' be the area of the plane region \( R \) bounded by closed curve \( C \). Let \( M = -y \) & \( N = x \).

Then \( \frac{\partial M}{\partial y} = -1 \) and \( \frac{\partial N}{\partial x} = 1 \). So by Green's theorem, we have

\[
\oint_C (M \, dx + N \, dy) = \iint_R \left( \frac{\partial N}{\partial x} - \frac{\partial M}{\partial y} \right) \, dx \, dy = 2 \iint_R \, dx \, dy
\]

\[
\therefore \text{Area of region } R = \iint_R \, dx \, dy = \frac{1}{2} \oint_C (-y \, dx + x \, dy).
\]

- In polar coordinates \( x = r \cos \theta, y = r \sin \theta \).

\[
\iint_R \, dx \, dy \text{ (Area of region } R) = \frac{1}{2} \oint_C (-y \, dx + x \, dy)
\]

\[
= \frac{1}{2} \oint_C \left[ (-r \sin \theta)(-r \sin \theta \, d\theta + \cos \theta \, dr) + (r \cos \theta)(r \cos \theta \, d\theta + \sin \theta \, dr) \right]
\]

\[
= \frac{1}{2} \oint_C (r^2 \sin^2 \theta \, d\theta + r^2 \cos^2 \theta \, d\theta) = \frac{1}{2} \oint_C r^2 \, d\theta.
\]
\[ \therefore \text{Area of region } R = \frac{1}{2} \int_C r^2 \, d\theta. \]

**METHOD -9: EXAMPLES OF GREEN'S THEOREM**

| C | 1 | State Green's theorem and use it to evaluate the integral \( \oint_C \{ y^2 \, dx + x^2 \, dy \} \), where \( C \) is the triangle bounded by \( x = 0, \ x + y = 1 \) & \( y = 0 \).  
   | Answer: 0. |
|---|---|---|---|
| H | 2 | Using Green's theorem, evaluate the integral \( \oint_C \{ x y^3 \, dx + (x^2 - y^2) \, dy \} \), where \( C \) is the triangle bounded by \( x = 0, \ x + y = 1 \) & \( y = 0 \).  
   | Answer: \( \frac{17}{60} \). |
| T | 3 | Using Green's theorem evaluate \( \oint_C \{ x^2 y \, dx + x^2 \, dy \} \) where \( C \) is the boundary of the triangle whose vertices are \( (0,0), (1,0), (1,1) \).  
   | Answer: \( \frac{1}{4} \). |
| C | 4 | State the Green's theorem and also evaluate the following integral \( \oint_C \{ (6y + x)dx + (y + 2x)dy \} \) where \( C: (x - 2)^2 + (y - 3)^2 = 4 \).  
   | Answer: \(-16\pi\). |
| T | 5 | Using Green's theorem evaluates the line integral \( \oint_C \{ \sin y \, dx + \cos x \, dy \} \) counter clock wise, where \( C \) is the boundary of the triangle with vertices \( (0,0), (\pi,0) \) & \( (\pi,1) \).  
   | Answer: \( \pi \cos 1 - \pi - 1 \). |
| H | 6 | Evaluate \( \oint_C \{ (x^2 + 2y)dx + (4x + y^2)dy \} \) by Green's theorem where \( C \) is the boundary of the region by \( y = 0, \ y = 2x \) & \( x + y = 3 \).  
   | Answer: 6. |
| T | 7 | Use Green's theorem to evaluate \( \oint_C \{ x^2 y \, dx + y^3 \, dy \} \), where \( c \) is the closed path formed by \( y = x \) and \( y = x^3 \) from \( (0,0) \) to \( (1,1) \).  
   | Answer: \(-\frac{1}{12}\). |
| T | 8 | Apply Green’s theorem to find the outward flux of a vector field $\vec{F} = \frac{1}{xy} (x \, \hat{i} + y \, \hat{j})$ across the curve bounded by $y = \sqrt{x}$, $2y = 1$ and $x = 1$. 
Answer: 0. |
|---|---|---|
| C | 9 | Find area of ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ by Green’s theorem. 
Answer: $\pi ab$. |
| H | 10 | Find the area of a circle of radius ‘r’ using Green’s theorem. 
Answer: $\pi r^2$. |
| T | 11 | Find area of asteroid $x^2 + y^2 = a^2$ by Green’s theorem. 
Answer: $\frac{3\pi a^2}{8}$. |
| T | 12 | Find area of region bounded by the parabola $y = x^2$ & line $y = x + 2$ using Green’s theorem. 
Answer: $\frac{9}{2}$. |
| C | 13 | Verify Green's theorem for the function $\vec{F} = (x + y) \, \hat{i} + 2xy \, \hat{j}$ and $C$ is the rectangle in the $xy$-plane bounded by $x = 0$, $y = 0$, $x = a \& y = b$. 
Answer: $ab(b - 1)$. |
| H | 14 | Verify Green’s theorem for $\vec{F} = x^2 \, \hat{i} + xy \, \hat{j}$ under square bounded by $x = 0$, $x = 1$, $y = 0 \& y = 1$. 
Answer: $\frac{1}{2}$. |
| H | 15 | Verify Green’s theorem for $\oint_C (3x - 8y^2) \, dx + (4y - 6xy) \, dy$, where $C$ is the boundary of the triangle with vertices $(0, 0), (1, 0) \& (0, 1)$. 
Answer: $\frac{5}{3}$. |
| H | 16 | Verify Green’s Theorem for $\oint_C (x^2 - 2xy) \, dx + (x^2y - 3) \, dy$, where $C$ is the boundary of the region bounded by the parabola $x^2 = y$ and line $y = x$. 
Answer: $\frac{1}{4}$ |
| T | 17 | Verify Green's Theorem in the plane for \( \oint_C (3x^2 - 8y^2) \, dx + (4y - 6xy) \, dy \), where \( C \) is the boundary of the region defined by \( y^2 = x \) & \( x^2 = y \).  
**Answer:** \( \frac{3}{2} \). |
|---|---|---|
| T | 18 | Verify Green's theorem for the field \( \vec{F} = (x - y) \hat{i} + x \hat{j} \) and the region \( R \) bounded by the unit circle \( C: \vec{r}(t) = (\cos t) \hat{i} + (\sin t) \hat{j} \); \( 0 \leq t \leq 2\pi \).  
OR  
Verify Green's theorem for the field \( \vec{F} = (x - y) \hat{i} + x \hat{j} \) and \( C \) is \( x^2 + y^2 = 1 \).  
**Answer:** \( 2\pi \). |
| C | 19 | Verify tangential form of Green's theorem for \( \vec{F} = (x - \sin y) \hat{i} + (\cos y) \hat{j} \), where \( C \) is the boundary of the region bounded by the lines \( y = 0 \), \( x = \pi/2 \) and \( y = x \).  
**Answer:** 1. |

★ ★ ★ ★ ★ ★ ★ ★ ★
UNIT-2 » LAPLACE TRANSFORM

✈ INTRODUCTION:

✓ Pierre Simon Marquis De Laplace (1749-1827) was French mathematician.
✓ Laplace transform converts a function of some domain into a function of another domain, without changing the value of a function.
✓ For example: From time domain function to frequency domain function
✓ Laplace transform is very flexible tool for solving differential equations.
✓ LT reduce the problem of differential equation into problem of an algebraic equation. Algebraic equations are easier to solve compare to differential equation.
✓ Another advantage of LT is that it solves problem directly i.e. by using Laplace transform we can find particular solution of a differential equation without determining the general solution.
✓ We can find solutions of a system of ODE, PDE and integral equations.

✈ LAPLACE TRANSFORM(LT):

✓ Let \( f(t) \) be a given function defined for all \( t \geq 0 \),
✓ The Laplace transform of \( f(t) \) is denoted by \( \mathcal{L}\{ f(t) \} \) or \( \mathcal{F}(s) \) or \( F(s) \) where \( s \) is a parameter (real or complex),
✓ The Laplace transform of \( f(t) \) is defined as

\[
F(s) = \mathcal{L}\{ f(t) \} = \int_{0}^{\infty} e^{-st} f(t) \, dt, \quad \text{provided the integral exist.}
\]

✈ SUFFICIENT CONDITION FOR EXISTENCE OF LT:

✓ The LT of \( f(t) \) exists when the following two conditions are satisfied:

(1) \( f(t) \) should be piecewise continuous function
(2). \( f(t) \) should be of exponential order of \( \alpha \), i.e. \( \exists M \& \alpha \exists |f(t)| \leq M \cdot e^{\alpha t}, t \geq 0. \)

- \( \mathcal{L}\{\tan t\} \) does not exist because \( \tan t \) is not piecewise continuous.
- \( \mathcal{L}\{e^{t^2}\} \) does not exist because \( e^{t^2} \) is not of exponential order.

**LINEARITY PROPERTY OF LT:**

- \( \mathcal{L}\{a \cdot f(t) + b \cdot g(t)\} = a \cdot \mathcal{L}\{f(t)\} + b \cdot \mathcal{L}\{g(t)\} \)

**LT OF SOME ELEMENTRY FUNCTIONS:**

1. \( \mathcal{L}\{k\} = \frac{k}{s}, \quad s > 0 \)
2. \( \mathcal{L}\{e^{at}\} = \frac{1}{s-a}, \quad s > a \) \& \( \mathcal{L}\{e^{-at}\} = \frac{1}{s+a}, \quad s > -a \)
3. \( \mathcal{L}\{\sin at\} = \frac{a}{s^2 + a^2}, \quad s > 0 \) and \( a \) is a constant
4. \( \mathcal{L}\{\cos at\} = \frac{s}{s^2 + a^2}, \quad s > 0 \) and \( a \) is a constant
5. \( \mathcal{L}\{\sinh at\} = \frac{a}{s^2 - a^2}, \quad s^2 > a^2 \) or \( (s > |a|) \)
6. \( \mathcal{L}\{\cosh at\} = \frac{s}{s^2 - a^2}, \quad s^2 > a^2 \) or \( (s > |a|) \)
7. \( \mathcal{L}\{t^n\} = \frac{n!}{s^{n+1}}; \quad n \) is integer

- \( \mathcal{L}\{t^n\} = \frac{n!}{s^{n+1}}; \quad n > -1 \)

**USEFUL FORMULAE:**

1. \( \int e^{ax} \sin bx \ dx = \frac{e^{ax}}{a^2 + b^2} \{a \sin bx - b \cos bx\} + c \)
2. \( \int e^{ax} \cos bx \ dx = \frac{e^{ax}}{a^2 + b^2} \{a \cos bx + b \sin bx\} + c \)
3. \( \sinh x = \frac{e^x - e^{-x}}{2}, \quad \cosh x = \frac{e^x + e^{-x}}{2} \)
4. \( \Gamma(n + 1) = \int_0^\infty e^{-x} x^n \ dx; \quad n < -1. \)
\(\Gamma(n + 1) = n \cdot \Gamma(n), n > 0\)

\(\Gamma(n + 1) = n!, \text{if } n \text{ is positive integer.}\)

**METHOD – 1: EXAMPLES ON DEFINITION OF LT**

UNIT-2 » Laplace Transform

H 10
Find the Laplace transform of \( f(t) = \begin{cases} 0 & ; 0 < t < \pi \\ \sin t & ; t > \pi \end{cases} \).

Answer: \( -\frac{e^{-\pi s}}{s^2 + 1} \)

❖ SOME IMPORTANT FORMULAE:

\[
2 \sin A \cos B = \sin(A + B) + \sin(A - B) \\
2 \cos A \sin B = \sin(A + B) - \sin(A - B) \\
2 \cos A \cos B = \cos(A + B) + \cos(A - B) \\
2 \sin A \sin B = \cos(A - B) - \cos(A + B)
\]

\[
\cos^3 A = \frac{3 \cos A + \cos 3A}{4} \\
\sin^3 A = \frac{3 \sin A - \sin 3A}{4} \\
cosh at = \frac{e^{at} + e^{-at}}{2} \\
\sinh at = \frac{e^{at} - e^{-at}}{2}
\]

\[
\Gamma(n + 1) = n \Gamma(n), \quad n > 0 \\
\Gamma\left(\frac{1}{2}\right) = \sqrt{\pi} \\
\Gamma\left(n + \frac{1}{2}\right) = \left(2n!\right)\frac{\sqrt{\pi}}{n!4^n}, \quad n = 0,1,2,3, ...
\]

METHOD – 2: EXAMPLES ON LT OF SIMPLE FUNCTIONS

H 1
Find the Laplace transform of \( t^3 + e^{-3t} + \frac{1}{t^2} \).

Answer: \( \frac{3!}{s^4} + \frac{1}{s^3} + \frac{\sqrt{\pi}}{2s^{3/2}} \)

H 2
Find the Laplace transform of \( t^5 + e^{-100t} + \cos 5t \).

Answer: \( \frac{5!}{s^6} + \frac{1}{s + 100} + \frac{s}{s^2 + 25} \)
### UNIT-2 » Laplace Transform

| H | 3 | Find the Laplace transform of \(\sin \frac{t}{2} + 2t + t^4\).  
|   |   | **Answer:** \(\frac{2}{(4s^2 + 1)} + \frac{1}{s - \log 2} + \frac{4 \Gamma(1/3)}{9s^{7/3}}\)  
| C | 4 | Find the Laplace transform of \(10^t + 2t^{10} + \sin 10t\).  
|   |   | **Answer:** \(\frac{1}{s - \log 10} + \frac{2 \cdot 10!}{s^{11}} + \frac{10}{s^2 + 100}\)  
| H | 5 | Find \(L[(2t - 1)^2]\).  
|   |   | **Answer:** \(\frac{8}{s^3} - \frac{4}{s^2} + \frac{1}{s}\)  
| H | 6 | Find the Laplace transformation (i) \(\sin(\omega t + \alpha)\)  
|   |   | (ii) \(\cos(\omega t + \beta)\)  
|   |   | **Answer:**  
|   |   | (i) \(\cos \alpha \frac{s}{s^2 + \omega^2} + \sin \alpha \frac{s}{s^2 + \omega^2}\)  
|   |   | (ii) \(\cos \beta \frac{s}{s^2 + \omega^2} - \sin \beta \frac{\omega}{s^2 + \omega^2}\)  
| H | 7 | Find \(L[\sin 2t \cos 2t]\).  
|   |   | **Answer:** \(\frac{2}{s^2 + 16}\)  
| C | 8 | Find \(L[\sin 2t \sin 3t]\).  
|   |   | **Answer:** \(\frac{1}{2} \left[ \frac{s}{s^2 + 1} - \frac{s}{s^2 + 25} \right]\)  
| C | 9 | Find the Laplace transform of \(\sin^2 3t\).  
|   |   | **Answer:** \(\frac{18}{s(s^2 + 36)}\)  
| H | 10 | Find Laplace transform of \(\cos^2(at)\)  
|   |   | **Answer:** \(\frac{s^2 + 2a^2}{s(s^2 + 4a^2)}\)  
| H | 11 | Find \(L[\cos^2 t]\).  
|   |   | **Answer:** \(\frac{s^2 + 2}{s(s^2 + 4)}\)  
| C | 12 | Find Laplace transform of \(\sin^3(at)\).  
|   |   | **Answer:** \(\frac{6a^3}{(s^2 + a^2)(s^2 + 9a^2)}\)
### Laplace Transform

**UNIT-2** » Laplace Transform

| H | 13 | Find the Laplace transform of (i) \(\sin^3 2t\) (ii) \(\cos^3 2t\).  
|   |    | Answer: (i) \[\frac{48}{(s^2 + 4)(s^2 + 36)}\] (ii) \[\frac{s^3 + 28s}{(s^2 + 4)(s^2 + 36)}\]  |

| T | 14 | Find \(L\{\cos t \cos 2t \cos 3t\}\).  
|   |    | Answer: \[\frac{1}{4s} + \frac{s}{4(s^2 + 36)} + \frac{s}{4(s^2 + 16)} + \frac{s}{4(s^2 + 4)}\]  |

| T | 15 | Find the Laplace transformation of \(f(t) = \cosh^2 3t\).  
|   |    | Answer: \[\frac{1}{2s} + \frac{s}{2(s^2 - 36)}\]  |

**FIRST SHIFTING THEOREM FOR LT:**

If \(L\{f(t)\} = F(s)\), then \(L\{e^{at}f(t)\} = F(s - a)\)

Note: \(L\{e^{-at}f(t)\} = F(s + a)\).

**METHOD – 3: EXAMPLES ON FIRST SHIFTING THEOREM**

| C | 1 | Find \(L(e^{-3t} t^{3/2})\).  
|   |    | Answer: \[\frac{3\sqrt{\pi}}{4(s + 3)^2}\]  |

| H | 2 | By using first shifting theorem, obtain the value of \(L\{(t + 1)^2 e^t\}\).  
|   |    | Answer: \[\frac{2}{(s - 1)^3} + \frac{2}{(s - 1)^2} + \frac{1}{s - 1}\]  |

| H | 3 | Find \(L(e^{2t} \sin 3t)\).  
|   |    | Answer: \[\frac{3}{s^2 - 4s + 13}\]  |

| C | 4 | Obtain Laplace transform of \(e^{2t} \sin^2 t\)  
|   |    | Answer: \[\frac{2}{(s - 2)(s^2 - 4s + 8)}\]  |

| H | 5 | Find Laplace transform of \(e^{-2t}(\sin 4t + t^2)\).  
|   |    | Answer: \[\frac{4}{s^2 + 4s + 20} + \frac{2}{(s + 2)^3}\]  |
### Problem Solutions

| H | 6 | Find Laplace transform of \( e^{-3t}(2 \cos 5t - 3 \sin 5t) \).
|   |   | Answer: \( \frac{2s - 9}{s^2 + 6s + 34} \)

| H | 7 | Find Laplace transform of \( e^{4t}(\sin 2t \cos t) \).
|   |   | Answer: \( \frac{1}{2} \left[ \frac{3}{(s^2 - 8s + 25)} + \frac{1}{(s^2 - 8s + 17)} \right] \)

| C | 8 | Find the Laplace transformation of \( f(t) = \frac{\cos 2t \sin t}{e^{2t}} \).
|   |   | Answer: \( \frac{1}{2} \left( \frac{3}{(s^2 + 4s + 13)} - \frac{1}{(s^2 + 4s + 5)} \right) \)

| C | 9 | Find \( \mathcal{L}\{ \cosh 2t \cos 2t \} \).
|   |   | Answer: \( \frac{1}{2} \left( \frac{s - 2}{s^2 - 4s + 8} + \frac{s + 2}{s^2 + 4s + 8} \right) \)

| H | 10 | Find the Laplace transform of \( f(t) = t^2 \sinh \pi t \).
|    |   | Answer: \( \frac{1}{(s - \pi)^3} - \frac{1}{(s + \pi)^3} \)

| T | 11 | Find \( \mathcal{L}\{ e^{-4t} \sinh t \sin t \} \).
|    |   | Answer: \( \frac{2(s + 4)}{(s^2 + 6s + 10)(s^2 + 10s + 26)} \)

### Differentiation of LT: (Multiplication by \( t \))

If \( \mathcal{L}\{ f(t) \} = F(s) \), \( \mathcal{L}\{ t^n \cdot f(t) \} = (-1)^n \frac{d^n}{ds^n} \{ F(s) \}; \ n = 1, 2, 3, \ldots \)

### Method - 4: Examples on Differentiation of LT

| H | 1 | Find the value of \( \mathcal{L}\{ t e^{-t} \} \).
|   |   | Answer: \( \frac{1}{(s + 1)^2} \)

| H | 2 | Find the value of \( \mathcal{L}\{ t \sin at \} \).
|   |   | Answer: \( \frac{2as}{(s^2 + a^2)^2} \)

### Integration of LT: (Division by T)

If $\mathcal{L}\{f(t)\} = F(s)$, then

$$\mathcal{L}\left\{\frac{f(t)}{t}\right\} = \int_{s}^{\infty} \{F(s)\} \ ds$$
UNIT-2 » Laplace Transform

\[ \mathcal{L} \left\{ \frac{f(t)}{t^2} \right\} = \int_s^\infty \int_s^\infty \{ F(s) \} \, ds \, ds \]

**METHOD – 5: EXAMPLES ON INTEGRATION OF LT**

| H  | 1               | Find \( \mathcal{L} \left\{ \frac{1 - e^t}{t} \right\} \).  
               | **Answer**: \( \log \left( \frac{s - 1}{s} \right) \) |
| C  | 2               | Find \( \mathcal{L} \left\{ \frac{e^{-bt} - e^{-at}}{t} \right\} \).  
               | **Answer**: \( \log \left( \frac{s + a}{s + b} \right) \) |
| H  | 3               | Find \( \mathcal{L} \left\{ \frac{\sin \omega t}{t} \right\} \).  
               | **Answer**: \( \tan^{-1} \left( \frac{\omega}{s} \right) \) |
| C  | 4               | Find the Laplace transform of \( \frac{1 - \cos 2t}{t} \).  
               | **Answer**: \( \log \left( \frac{\sqrt{1 + 4}}{s^2} \right) \) |
| H  | 5               | Find the Laplace transform of \( \frac{\cos at - \cos bt}{t} \).  
               | **Answer**: \( \log \left( \frac{s^2 + b^2}{s^2 + a^2} \right) \) |
| C  | 6               | Find \( \mathcal{L} \left\{ \frac{e^t \sin t}{t} \right\} \).  
               | **Answer**: \( \cot^{-1}(s - 1) \) |
| C  | 7               | Find \( \mathcal{L} \left\{ \frac{1 - \cos t}{t^2} \right\} \).  
               | **Answer**: \( -\frac{s}{2} \log \left( 1 + \frac{1}{s^2} \right) + \cot^{-1}(s) \) |
UNIT-2 » Laplace Transform

**T 8** Find \( \mathcal{L}\left\{ \frac{\sin^2 t}{t^2} \right\} \).

**Answer:**\( \frac{1}{4}\left[ -s \log \left( 1 + \frac{4}{s^2} \right) + 4 \cot^{-1}\left( \frac{s}{2} \right) \right] \)

**LT OF DERIVATIVES:**

- If \( \mathcal{L}\{ f(t) \} = F(s) \), then
  \[
  \mathcal{L}\{ f'(t) \} = sF(s) - f(0)
  \]
  \[
  \mathcal{L}\{ f''(t) \} = s^2F(s) - sf(0) - f'(0)
  \]
  
  \[
  \vdots
  \]
  \[
  \mathcal{L}\{ f^n(t) \} = s^nF(s) - s^{n-1}f(0) - s^{n-2}f'(0) - s^{n-3}f''(0) - \cdots - f^{n-1}(0)
  \]

**METHOD – 6: EXAMPLES ON LT OF DERIVATIVES**

| H  | 1   | Find \( \mathcal{L}\{ f'(t) \} \) if \( f(t) = \sin^2 t \).
|    |     | **Answer:** \( \frac{2}{(s^2 + 4)} \) |
| H  | 2   | Find \( \mathcal{L}\{ f(t) \} \) and \( \mathcal{L}\{ f'(t) \} \) when \( f(t) = t \cos t \)
|    |     | **Answer:** \( \frac{s(s^2 - 1)}{(s^2 + 1)^2} \) |
| C  | 3   | Find \( \mathcal{L}\{ f(t) \} \) and \( \mathcal{L}\{ f'(t) \} \) when \( f(t) = \frac{\sin t}{t} \).
|    |     | **Answer:** \( \cot^{-1} s, \quad s \cot^{-1} s - 1 \) |
| C  | 4   | Find \( \mathcal{L}\{ f(t) \} \) and \( \mathcal{L}\{ f'(t) \} \) when \( f(t) = \frac{\sin t}{e^{5t}} \).
|    |     | **Answer:** \( \frac{1}{(s + 5)^2 + 1}, \quad \frac{s}{s^2 + 10s + 26} \) |
| H  | 5   | Find \( \mathcal{L}\{ f'(t) \} \) if \( f(t) = e^{2t} \sin 3t. \)
|    |     | **Answer:** \( \frac{3s}{s^2 - 4s + 13} \) |
### UNIT-2 » Laplace Transform

| C  | 9   | Find the Laplace transformation of $f(t) = \int_0^t e^t \sin t \, dt$.  
  |     | Answer: $\frac{\cot^{-1}(s - 1)}{s}$  |
Find $\mathcal{L}\left\{ \int_0^t \int_0^s \sin at \, dt \, dt \right\}$.

Answer: $\frac{a}{s^2 (s^2 + a^2)}$

**LT of Unit Step Function:**

- Unit step function is defined as
  
  \[ u(t) = \begin{cases} 
  0; & t < 0 \\ 
  1; & t > 0 
  \end{cases} \]

- Delayed or Displaced unit step function $u(t - a)$ represent the function $f(t)$ which is displaced by $a$ distance to the right
  
  \[ u(t - a) = \begin{cases} 
  0; & t < a \\ 
  1; & t > a 
  \end{cases} \]

- Laplace transform of the unit step function $u(t)$ is
  \[ \mathcal{L}\{ u(t) \} = \frac{1}{s} \]

- Laplace transform of the displaced unit step function $u(t - a)$ is
  \[ \mathcal{L}\{ u(t - a) \} = \frac{e^{-as}}{s} \]

- Instead of $u(t - a)$, we can also write $H(t - a)$, which is referred as Heaviside’s unit step function.

**Second Shifting Theorem:**

If $\mathcal{L}\{ f(t) \} = F(s)$, then $\mathcal{L}\{ f(t - a) \cdot u(t - a) \} = e^{-as} \mathcal{L}\{ f(t) \}$

$\mathcal{L}\{ f(t) \cdot u(t - a) \} = e^{-as} \mathcal{L}\{ f(t + a) \}$

**Answer:** \( \frac{2(e^{-2\pi s} - e^{-4\pi s})}{s^2 + 4} \) |   |   |   |   |

**W 2019 (1)**

**S 2019 (4)**
**LT OF DIRAC’S DELTA FUNCTION:**

- A Dirac’s delta Function or Unit Impulse Function \( \delta(t - a) \) is defined as
  \[
  \delta(t - a) = \lim_{\varepsilon \to 0} f(t)
  \]

- Where, \( f(t) \) is an impulse function, which is defined as
  \[
  f(t) = \begin{cases} 
    0 & ; \quad t < a \\
    \frac{1}{\varepsilon} & ; \quad a \leq t \leq a + \varepsilon \\
    0 & ; \quad t > a + \varepsilon
  \end{cases}
  \]

- Laplace transform of unit impulse function \( \delta(t - a) \) is \( \mathcal{L}\{ \delta(t - a) \} = e^{-as}. \)

- Laplace transform of function \( f(t) \delta(t - a) \) is \( \mathcal{L}\{ f(t) \delta(t - a) \} = e^{-as}f(a). \)

- \( \mathcal{L}\{ \delta(t) \} = 1 \)

**METHOD - 9: EXAMPLES ON LT OF DIRAC’S DELTA FUNCTIONS**

| H | 1 | Find the \( \mathcal{L}\{ \delta(t - 3) \} \).
| Answer: \( e^{-3s} \) |
| C | 2 | Find the \( \mathcal{L}\{ t \delta(t - 2) \} \).

| Answer: \( e^{-3s+9} \) |
| C | 4 | Find the \( \mathcal{L}\{ e^{3t} \delta(t - 3) + t^2 u(t - 3) \} \).
| Answer: \( e^{-3s+9} + e^{-3s} \left( \frac{2}{s^3} + \frac{6}{s^2} + \frac{9}{s} \right) \) |
| T | 5 | Find the \( \mathcal{L}\{ t^2 \delta(t - 4) + t u(t - 4) \} \).
| Answer: \( e^{-4s} \left( \frac{1}{s^2} + \frac{4}{s} + 16 \right) \) |

**LT OF PERIODIC FUNCTION:**

- A function \( f(t) \) is known as periodic function if for a constant \( T > 0 \), \( f(T + t) = f(t) \) for all \( t \).

- In general, \( f(nT + t) = f(t) \), where \( n \) is integer & \( T \) is the period of the function.
UNIT-2 » Laplace Transform

- Let \( f(t) \) is a piecewise continuous periodic function with period \( T \). The Laplace transform of \( f(t) \) is
  \[
  F(s) = \mathcal{L}\{ f(t) \} = \frac{1}{1 - e^{-Ts}} \int_0^T e^{-st} f(t) \, dt,
  \]
  where \( s > 0 \).

**UNIT-2 » Laplace Transform**

- **INVERSE LAPLACE TRANSFORM (ILT):**
  - If \( F(s) = \mathcal{L}\{ f(t) \} \) then \( f(t) \) is known as the Inverse Laplace transform of \( F(s) \). The Inverse Laplace transform of \( F(s) \) is denoted as \( \mathcal{L}^{-1}\{ F(s) \} = f(t) \).

- **LINEARITY PROPERTY OF ILT:**
  \[
  \mathcal{L}^{-1}\{ a \cdot F(s) + b \cdot G(s) \} = a \cdot \mathcal{L}^{-1}\{ F(s) \} + b \cdot \mathcal{L}^{-1}\{ G(s) \}
  \]

- **ILT OF SOME ELEMENTARY FUNCTIONS:**
  \[
  \begin{align*}
  \mathcal{L}^{-1}\left( \frac{1}{s} \right) &= 1 \\
  \mathcal{L}^{-1}\left( \frac{1}{s-a} \right) &= e^{at} \\
  \mathcal{L}^{-1}\left( \frac{1}{s^2 + a^2} \right) &= \frac{1}{a} \sin at \\
  \mathcal{L}^{-1}\left( \frac{1}{s^2 - a^2} \right) &= \frac{1}{a} \sinh at
  \end{align*}
  \]
  \[
  \begin{align*}
  \mathcal{L}^{-1}\left( \frac{1}{s^n} \right) &= \frac{t^{n-1}}{(n-1)!} \quad \text{OR} \quad \frac{t^{n-1}}{\Gamma(n)} \\
  \mathcal{L}^{-1}\left( \frac{1}{s + a} \right) &= e^{-at} \\
  \mathcal{L}^{-1}\left( \frac{s}{s^2 + a^2} \right) &= \cos at \\
  \mathcal{L}^{-1}\left( \frac{s}{s^2 - a^2} \right) &= \cosh at
  \end{align*}
  \]

**METHOD – 11: EXAMPLES ON ILT**

**ILT OF INTEGRAL:**

If $\mathcal{L}^{-1}\left\{ F(s) \right\} = f(t)$, then

$$\mathcal{L}^{-1}\left\{ \int_{s}^{\infty} F(s) \, ds \right\} = \frac{\mathcal{L}^{-1}\left\{ F(s) \right\}}{t}$$

$$\mathcal{L}^{-1}\left\{ F(s) \right\} = t \mathcal{L}^{-1}\left\{ \int_{s}^{\infty} F(s) \, ds \right\}$$
METHOD – 17: EXAMPLES ON ILT OF INTEGRAL

C 1

Find \( \mathcal{L}^{-1} \left\{ \int_{s}^{\infty} \frac{1}{s + 1} \, ds \right\} \).

Answer: \( e^{-t} \)

H 2

Find \( \mathcal{L}^{-1} \left\{ \frac{1}{(s + 1)^2} \right\} \) using ILT of integral.

Answer: \( t \, e^{-t} \)

C 3

Find \( \mathcal{L}^{-1} \left\{ \frac{2s}{(s^2 + 1)^2} \right\} \).

Answer: \( t \sin t \)

H 4

Find \( \mathcal{L}^{-1} \left\{ \frac{s}{(s^2 - a^2)^2} \right\} \).

Answer: \( \frac{t}{2a} \) sinh at

CONVOLUTION PRODUCT:

✓ The convolution of two function \( f \) and \( g \) is denoted by \( f \ast g \) and is defined as

\[
f \ast g = \int_{0}^{t} f(u) \cdot g(t-u) \, du = \int_{0}^{t} f(t-u) \cdot g(u) \, du
\]

CONVOLUTION THEOREM:

✓ If \( \mathcal{L}^{-1} \{ F(s) \} = f(t) \) and \( \mathcal{L}^{-1} \{ G(s) \} = g(t) \), then

\[
\mathcal{L}^{-1} \{ F(s) \cdot G(s) \} = \int_{0}^{t} f(u) \cdot g(t-u) \, du = f(t) \ast g(t)
\]

METHOD – 18: EXAMPLES ON CONVOLUTION THEOREM

C 1

State convolution theorem and using it find \( \mathcal{L}^{-1} \left\{ \frac{1}{(s + 1)(s + 3)} \right\} \).

Answer: \( \frac{e^{-t} - e^{-3t}}{2} \)
Using the convolution theorem, obtain the value of \( \mathcal{L}^{-1}\left\{ \frac{1}{s(s^2 + a^2)} \right\} \).

**Answer:** \( \frac{1 - \cos at}{a^2} \)

State convolution theorem and use it to evaluate \( \mathcal{L}^{-1}\left\{ \frac{a}{s^2(s^2 + a^2)} \right\} \).

**Answer:** \( \frac{at - \sin at}{a^2} \)

State Convolution Theorem and Use to it Evaluate \( \mathcal{L}^{-1}\left\{ \frac{1}{(s^2 + a^2)^2} \right\} \).

**Answer:** \( \frac{1}{2a^3}(\sin at - \cos at) \)

Using convolution theorem, obtain \( \mathcal{L}^{-1}\left\{ \frac{1}{(s^2 + 4)^2} \right\} \).

**Answer:** \( \frac{1}{16}(\sin 2t - 2t \cos 2t) \)

Apply convolution theorem to Evaluate \( \mathcal{L}^{-1}\left\{ \frac{s}{(s^2 + a^2)^2} \right\} \).

**Answer:** \( \frac{t \sin at}{2a} \)

Find the inverse Laplace transform of \( \frac{s}{(s^2 + 1)^2} \).

**Answer:** \( \frac{t \sin t}{2} \)

State convolution theorem and using it find \( \mathcal{L}^{-1}\left\{ \frac{s^2}{(s^2 + a^2)(s^2 + b^2)} \right\} \).

**Answer:** \( \frac{a \sin at - b \sin bt}{a^2 - b^2} \)

State convolution theorem and using it to find \( \mathcal{L}^{-1}\left\{ \frac{s^2}{(s^2 + 9)(s^2 + 4)} \right\} \).

**Answer:** \( \frac{3 \sin 3t - 2 \sin 2t}{5} \)

Using the convolution theorem, Find \( \mathcal{L}^{-1}\left( \frac{1}{(s - 2)(s + 2)^2} \right) \).

**Answer:** \( \frac{e^{2t} - e^{-2t} - 4t e^{-2t}}{16} \)
| C   | 11 | Using the convolution theorem, Find the inverse Laplace transform of $\frac{s}{(s+1)(s-1)^2}$.
|     |    | Answer: $\frac{t e^t}{2} + \frac{e^t - e^{-t}}{4}$
| C   | 12 | Find $L^{-1}\left\{ \frac{s + 2}{(s^2 + 4s + 5)^2} \right\}$.
|     |    | Answer: $\frac{e^{-2t} t \sin t}{2}$
| T   | 13 | Find $L^{-1}\left\{ \frac{s(s + 1)}{(s^2 + 1)(s^2 + 2s + 2)} \right\}$.
|     |    | Answer: $\frac{e^{-t}[2 \sin t - 6\cos t] + 2\sin t + 6\cos t}{10}$
| T   | 14 | Using the convolution theorem, Find $L^{-1}\left\{ \frac{1}{s(s + a)^3} \right\}$.
|     |    | Answer: $\frac{e^{-st}}{-a} \left[ \frac{t^2}{2} + \frac{t}{a} + \frac{1}{a^2} \right] + \frac{1}{a^3}$

**PARTIAL FRACTION METHOD:**

- **Case 1:** If the denominator has non-repeated linear factors $(s - a), (s - b), (s - c)$, then
  
  \[
  \frac{F(s)}{(s-a)(s-b)(s-c)} = \frac{A}{s-a} + \frac{B}{s-b} + \frac{C}{s-c}
  \]

- **Case 2:** If the denominator has repeated linear factors $(s - a), (n$ times), then
  
  \[
  \frac{F(s)}{(s-a)^n} = \frac{A_1}{s-a} + \frac{A_2}{(s-a)^2} + \frac{A_3}{(s-a)^3} + \cdots + \frac{A_n}{(s-a)^n}
  \]

- **Case 3:** If the denominator has non-repeated quadratic factors $(s^2 + as + b)$ & $(s^2 + cs + d)$, then
  
  \[
  \frac{F(s)}{(s^2 + as + b)(s^2 + cs + d)} = \frac{As + B}{(s^2 + as + b)} + \frac{Cs + D}{(s^2 + cs + d)}
  \]

- **Case 4:** If the denominator has repeated quadratic factors $(s^2 + as + b)-(n$ times), then
  
  \[
  \frac{F(s)}{(s^2 + as + b)^n} = \frac{As + B}{(s^2 + as + b)} + \frac{Cs + D}{(s^2 + as + b)^2} + \cdots + \frac{# s + #^*}{(s^2 + as + b)^n}
  \]
**Case 5:**

\[
\frac{F(s)}{(s + a)(s + b)^n} = \frac{A}{s + a} + \frac{B_1}{s + b} + \frac{B_2}{(s + b)^2} + \frac{B_3}{(s + b)^3} + \ldots + \frac{B_n}{(s + b)^n}
\]

\[
\frac{F(s)}{(s + a)(s + b)^2} = \frac{A}{s + a} + \frac{B_1}{s + b} + \frac{B_2}{(s + b)^2}
\]

**Case 6:**

\[
\frac{F(s)}{(s + a)(s^2 + as + b)^n} = \frac{A}{s + a} + \frac{Bs + C}{s^2 + as + b} + \frac{Ds + E}{(s^2 + as + b)^2} + \ldots + \frac{# s + #^*}{(s^2 + as + b)^n}
\]

\[
\frac{F(s)}{(s + a)(s^2 + as + b)^1} = \frac{A}{s + a} + \frac{Bs + C}{s^2 + as + b}
\]

---

❖ NOTATION:

- Let \( y \) is a function of independent variable \( t \) i.e. \( y(t) \)
- Let \( Y \) is a function of independent variable \( s \) i.e. \( Y(s) \)
- Now \( \mathcal{L}\{ y(t) \} = Y(s), \quad \mathcal{L}^{-1}\{ Y(s) \} = y(t) \)

❖ PROCEDURE TO SOLVE ODES WITH CONSTANT COEFFICIENTS USING LT:

(1) Apply LT on both the sides of ODE
(2). Find the value of $Y(s)$ from above equation

(3). Apply I LT on both the sides of $Y(s)$

(4). Find $y(t)$ which is a solution of given ODE

**FORMULAE IN NEW NOTATION:**

\[
\mathcal{L}\left\{ t^n \cdot y(t) \right\} = (-1)^n \frac{d^n}{ds^n} \{ Y(s) \}, \quad \mathcal{L}^{-1} \left\{ s^n \cdot Y(s) \right\} = \frac{d^n}{dt^n} \left[ \mathcal{L}^{-1} \{ Y(s) \} \right]
\]

\[
\mathcal{L}\left\{ \frac{y(t)}{t^2} \right\} = \int_s^\infty \int_s^\infty \{ Y(s) \} \ ds \ ds, \quad \mathcal{L}^{-1} \left\{ \frac{Y(s)}{s^2} \right\} = \int_0^t \int_0^t \left[ \mathcal{L}^{-1} \{ Y(s) \} \right] \ dt \ dt
\]

\[
\mathcal{L}\left\{ \frac{dy}{dt} \right\} = \mathcal{L}\{ y'(t) \} = s \ Y(s) - y(0)
\]

\[
\mathcal{L}\left\{ \frac{d^2y}{dt^2} \right\} = \mathcal{L}\{ y''(t) \} = s^2 \ Y(s) - s \ y(0) - y'(0)
\]

\[\vdots\]

\[
\mathcal{L}\left\{ \frac{d^ny}{dt^n} \right\} = \mathcal{L}\{ y^n(t) \} = s^n \ Y(s) - s^{n-1} \ y(0) - s^{n-2} \ y'(0) - s^{n-3} \ y''(0) - \ldots - s^{n-n} \ y^{n-1}(0)
\]

**METHOD – 20: EXAMPLES ON SOLVE ODES WITH CONSTANT COEFFICIENTS**

| C | 1 | Solve using Laplace transform: \( \frac{dy}{dt} - 2y = 4 \), at \( t = 0, y = 1 \).  
**Answer:** \( y(t) = 3e^{2t} - 2 \) |
| T | 2 | Solve using Laplace transform \( y'' + 6y = 1 \), \( y(0) = 2, y'(0) = 0 \).  
**Answer:** \( y(t) = \frac{11}{6} \cos \sqrt{6}t + \frac{1}{6} \) |
| T | 3 | Using the method of Laplace transform solve the IVP : \( y'' + 3y' + 2y = e^t \), \( y(0) = 1 \) and \( y'(0) = 0 \).  
**Answer:** \( y(t) = \frac{1}{6} e^t - \frac{3}{2} e^{-t} + \frac{2}{3} e^{-2t} \) |
### UNIT-2 » Laplace Transform

| C   | 4   | Using Laplace transform solve a differential equation \( \frac{d^2y}{dt^2} + 5 \frac{dy}{dt} + 6y = e^{-t} \), where \( y(0) = 0, y'(0) = -1 \).<br>
**Answer:** \( y(t) = \frac{1}{2} e^{-t} - 2e^{-2t} + \frac{3}{2} e^{-3t} \) | S 2019 (7) |
|-----|-----|---------------------------------------------------------------------------------|-------------|
| H   | 5   | Use the Laplace transform to solve the following initial value problem:<br>
\( y'' - 3y' + 2y = 12e^{-2t}, \ y(0) = 2 \) and \( y'(0) = 6 \).
**Answer:** \( y(t) = e^{-2t} + 7e^{2t} - 6e^t \) | (3) |
| H   | 7   | Using Laplace transform solve the IVP:<br>
\( y'' + y = \sin 2t, \ y(0) = 2, \ y'(0) = 1 \).
**Answer:** \( y(t) = \frac{5}{3} \sin t - \frac{1}{3} \sin 2t + 2 \cos t \) | (2) |
| C   | 8   | Using the Laplace transforms, find the solution of the initial value problem<br>
\( y'' + 25y = 10 \cos 5t, y(0) = 2, y'(0) = 0 \).
**Answer:** \( y(t) = t \sin 5t + 2 \cos 5t \) | W 2019 (4) |
| C   | 9   | Solve the initial value problem:<br>
\( y'' - 2y = e^t \sin t, \ y(0) = y'(0) = 0 \), using Laplace transform.<br>
**Answer:** \( y(t) = -\frac{1}{4} + \frac{1}{4} e^{2t} - \frac{1}{2} e^t \sin t \) | (1) |
| T   | 10  | Solve the differential equation using Laplace Transformation method<br>
\( y'' - 3y' + 2y = 4t + e^{3t}, \ y(0) = 1 \) and \( y'(0) = -1 \).
**Answer:** \( y(t) = 3 + 2t + \frac{1}{2} (e^{3t} - e^t) - 2e^{2t} \) | (3) |

**PROCEDURE TO SOLVE SYSTEM OF ODES USING LT:**

1. Apply LT on both the sides of both ODEs
2. Find the value of \( Y(s) \) & \( X(s) \) by solving above two equations
3. Apply ILT on both the sides of \( Y(s) \) & \( X(s) \)
4. Find \( y(t) \) & \( x(t) \) which is a solution of given ODEs
**METHOD – 21: EXAMPLES ON SOLVE SYSTEM OF ODES**

| H  | 1 | By using Laplace transform solve a system of differential equations $\frac{dx}{dt} = 1 - y$, $\frac{dy}{dt} = -x$, where $x(0) = 1$, $y(0) = 0$.  
*Answer: $y(t) = 1 - e^t$, $x(t) = e^t$ | S 2019 (7) |
|----|----|---------------------------------------------------------------------------------|-------------|
| H  | 2 | Solve the ODEs using LT:  
$\frac{dy}{dt} + x = 2$, $\frac{dx}{dt} + y = 1$, where $y(0) = 1$, $x(0) = 1$.  
*Answer: $y(t) = 1 + \sinh t$, $x(t) = 2 - \cosh t$ |
| C  | 3 | Solve the ODEs using LT:  
$\frac{dy}{dt} + x = \cos t$, $\frac{dx}{dt} + y = \sin t$, where $y(0) = 2$, $x(0) = 0$.  
*Answer: $y(t) = \sin t + 2 \cosh t$, $x(t) = -2 \sinh t$ |
| T  | 4 | Solve the ODEs using LT:  
$\frac{dy}{dt} + x = e^{-t}$, $\frac{dx}{dt} + 2y = e^t$, where $y(0) = 1$, $x(0) = 1$.  
*Answer: $y(t) = e^{-t} + e^t - \frac{e^{t\sqrt{2}}}{2} - \frac{e^{-t\sqrt{2}}}{2}$,  
$x(t) = 2e^{-t} - e^t + \frac{e^{t\sqrt{2}}}{\sqrt{2}} - \frac{e^{-t\sqrt{2}}}{\sqrt{2}}$ |
| T  | 5 | Solve the ODEs using LT:  
$\frac{dy}{dt} + 2x + y = 0$, $\frac{dx}{dt} - 2y + 5x = t$, where $y(0) = 0$, $x(0) = 0$.  
*Answer: $y(t) = \frac{4}{27} - \frac{2t}{9} - \frac{2e^{-3t}}{9}\left(\frac{2}{3} + t\right)$,  
$x(t) = \frac{1}{27} + \frac{t}{9} - \frac{e^{-3t}}{9}\left(\frac{1}{3} + 2t\right)$ |
| H  | 6 | Solve the ODEs using LT:  
$\frac{dx}{dt} + \frac{dy}{dt} + x - y = 1$, $\frac{dx}{dt} + \frac{dy}{dt} + x + y = e^t$  
where $y(0) = 0$, $x(0) = 1$.  
*Answer: $y(t) = \frac{(e^{-t} - 1)}{2}$, $x(t) = \frac{(e^{-t} + 1)}{2}$ |
UNIT-2 » Laplace Transform

C 7 Solve the ODEs using LT:
\[
d\frac{dx}{dt} + \frac{dy}{dt} + x - y = e^{-t}, \quad \frac{dx}{dt} + 2x + y = e^t
\]
where \( y(0) = 0 \), \( x(0) = 1 \).

Answer: \( y(t) = \sinh t - e^{-3t} \), \( x(t) = 2e^{-3t} \)

T 8 Solve the ODEs using LT:
\[
\frac{d^2x}{dt^2} + 2x = y, \quad \frac{d^2y}{dt^2} + 2y = x
\]
where \( y(0) = 2 \), \( x(0) = 4 \), \( y'(0) = 0 \), \( x'(0) = 0 \).

Answer: \( y(t) = -\cos(\sqrt{3} t) + 3\cos t \), \( x(t) = \cos(\sqrt{3} t) + 3\cos t \)

Procedure to Solve ODEs with Variable Coefficients Using LT:

1. Apply LT on both the sides of ODE
2. Find the value of \( Y(s) \) by solving step-1 ODE using IF
3. Find the value of \( c \) & Apply ILT on both the sides of \( Y(s) \)
4. Find \( y(t) \) which is a solution of given ODE

Formulae:
\[
\mathcal{L}\left\{t \cdot \frac{dy}{dt}\right\} = \mathcal{L}\left\{t \cdot y'\right\} = -\frac{d}{ds}\left[sY(s) - y(0)\right] = -Y(s) - s \frac{dY}{ds}
\]
\[
\mathcal{L}\left\{t \cdot \frac{d^2y}{dt^2}\right\} = \mathcal{L}\left\{t \cdot y''\right\} = -\frac{d}{ds}\left[s^2Y(s) - sy(0) - y'(0)\right] = -2sY(s) - s^2 \frac{dY}{ds} + y(0)
\]

\[
\frac{dY}{ds} + PY = Q, \quad IF = e^{\int P \, ds} \quad \text{&} \quad \text{Solution is} \; Y \cdot IF = \int \left(IF \cdot Q\right) \, ds + c
\]

Method - 22: Examples on Solve ODEs with Variable Coefficients

H 1 Solve using Laplace transform:
\[ty'' - y' = -1, \quad y(0) = 0.\]

Answer: \( 1 + c \cdot t^2 \)
| C | 2 | Solve using Laplace transform:  
    \[ y'' + 3ty' - 6y = 2, \quad y(0) = 1 \quad \& \quad y'(0) = 0. \]  
    **Answer:** \[ 1 + 4t^2 \] |
| H | 3 | Solve using Laplace transform:  
    \[ ty'' - ty' + y = 4, \quad y(0) = 4 \quad \& \quad y'(0) = -2. \]  
    **Answer:** \[ 4 - 2t \] |
| T | 4 | Solve using Laplace transform:  
    \[ ty'' + (2t - 1)y' - 2y = 0, \quad y(0) = 1. \]  
    **Answer:** \[ e^{-2t} + c\left(\frac{t}{2} + \frac{e^{-2t}}{4} - \frac{1}{4}\right) \] |
UNIT-3 » FOURIER INTEGRALS

INTRODUCTION:

We know that periodic functions (signals) defined on the finite interval \((-1, 1)\) can be expressed by Fourier series.

Non-periodic functions (signals) cannot be expressed by this series.

Many engineering problems deal with non-periodic functions.

Fourier integral can be considered as a limiting case of Fourier series.

Fourier integral is a formula for the decomposition of a non-periodic function into harmonic components.

FOURIER INTEGRALS:

Fourier integral of \(f(x)\) is given by

\[
f(x) = \int_{0}^{\infty} [A(\omega) \cos \omega x + B(\omega) \sin \omega x] \, d\omega,
\]

where

\[
A(\omega) = \frac{1}{\pi} \int_{-\infty}^{\infty} f(x) \cos \omega x \, dx,
\]

\[
B(\omega) = \frac{1}{\pi} \int_{-\infty}^{\infty} f(x) \sin \omega x \, dx.
\]

METHOD – 1: EXAMPLES ON FOURIER INTEGRALS

<table>
<thead>

\] |
### Unit-3 » Fourier Integrals

**C 2**

Find the Fourier integral representation of \( f(x) = \begin{cases} 1 & ; |x| < 1 \\ 0 & ; |x| > 1. \end{cases} \)

Hence calculate the followings:

\[
\begin{align*}
(a) & \int_{0}^{\infty} \left( \frac{\sin \lambda \cos \lambda x}{\lambda} \right) d\lambda \\
(b) & \int_{0}^{\infty} \left( \frac{\sin \omega}{\omega} \right) d\omega.
\end{align*}
\]

Answer: \( f(x) = \int_{0}^{\infty} \frac{2 \sin \omega}{\pi \omega} \cos \omega x \, d\omega \)

| \( |x| < 1 \) | \( |x| > 1 \) |
|----------------|----------------|
| \( \frac{\pi}{2} \) | \( \frac{\pi}{2} \) |

**H 3**

Find the Fourier integral representation of \( f(x) = \begin{cases} 2 & ; |x| < 2 \\ 0 & ; |x| > 2. \end{cases} \)

Answer: \( f(x) = \int_{0}^{\infty} \frac{4 \sin 2\omega}{\pi \omega} \cos \omega x \, d\omega \)

**C 4**

Find the Fourier integral representation of \( f(x) = \begin{cases} e^{kx} & ; x < 0 \\ e^{-kx} & ; x > 0. \end{cases} \)

Answer: \( f(x) = \frac{2}{\pi} \int_{0}^{\infty} \frac{\omega}{k^2 + \omega^2} \sin \omega \, d\omega \)

**T 5**

Find the Fourier integral representation of \( f(x) = \begin{cases} 2 & ; x < 0 \\ e^{-x} \sin x & ; x > 0. \end{cases} \)

Answer: \( f(x) = \frac{1}{\pi} \int_{0}^{\infty} \frac{(2 - \omega^2) \cos \omega x + 2\omega \sin 2\omega}{\omega^4 + 4} \, d\omega \)

---

**Fourier Cosine Integral**

- Fourier cosine integral of \( f(x) \) is given by

\[
f(x) = \int_{0}^{\infty} A(\omega) \cos \omega x \, d\omega,
\]

| where | \( A(\omega) = \frac{2}{\pi} \int_{0}^{\infty} \{ f(x) \cos \omega x \} \, dx \), \( B(\omega) = 0. \) |
### METHOD – 2: EXAMPLES ON FOURIER COSINE INTEGRALS

### FOURIER SINE INTEGRAL

✓ Fourier sine integral of \( f(x) \) is given by

\[
f(x) = \int_{0}^{\infty} B(\omega) \sin \omega x \, d\omega, \quad \text{where} \quad B(\omega) = \frac{2}{\pi} \int_{0}^{\infty} \{ f(x) \sin \omega x \} \, dx, \quad A(\omega) = 0.
\]

### METHOD – 3: EXAMPLES ON FOURIER SINE INTEGRALS

<table>
<thead>
<tr>
<th>C</th>
<th>Using Fourier integral prove that</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>( \int_{0}^{\infty} \frac{1 - \cos \omega \pi}{\omega} \sin \omega x , d\omega = \begin{cases} \pi/2 &amp; ; 0 &lt; x &lt; \pi \ 0 &amp; ; x &gt; \pi \end{cases} )</td>
</tr>
</tbody>
</table>
### Using Fourier Cosine integral representation show that

\[
\int_0^\infty \frac{\cos \omega x}{k^2 + \omega^2} \, d\omega = \frac{\pi e^{-kx}}{2k}.
\]

### Express \( f(x) = \begin{cases} 1 & ; 0 \leq x \leq \pi \\ 0 & ; x > \pi \end{cases} \) as a Fourier Sine integral and hence evaluate \( \int_0^\infty \frac{1 - \cos \lambda \pi}{\lambda} \sin \lambda x \, d\lambda \).

**Answer:**

\[
f(x) = \left\{ \begin{array}{ll}
\frac{2}{\pi} \int_0^\infty \frac{1 - \cos \omega \pi}{\omega} \sin \omega x \, d\omega, & ; 0 \leq x \leq \pi \\
0, & ; x > \pi
\end{array} \right.
\]

### Find Fourier sine integral representation of \( f(x) = e^{-x} \); \( x > 0 \).

**Answer:**

\[
f(x) = \frac{2}{\pi} \int_0^\infty \frac{\omega}{1 + \omega^2} \sin \omega x \, d\omega
\]

### Find Fourier cosine and sine integral of \( f(x) = \begin{cases} \sin x & ; 0 \leq x \leq \pi \\ 0 & ; x > \pi \end{cases} \).

**Answer:**

\[
\left\{ \begin{array}{ll}
\frac{2(1 + \cos \omega \pi)}{\pi (1 - \omega^2)} \cos \omega x \, d\omega; A(1) = 0, & \\
\int_0^\infty \frac{2 \sin \omega \pi}{\pi (1 - \omega^2)} \sin \omega x \, d\omega; B(1) = 1
\end{array} \right.
\]

UNIT-4 » DIFFERENTIAL EQUATION OF FIRST ORDER

❖ INTRODUCTION:

✓ A differential equation is a mathematical equation which involves differentials or differential coefficients. Differential equations are very important in engineering problem. Most common differential equations are Newton’s Second law of motion, Series RL, RC, and RLC circuits, etc.

✓ Mathematical modeling reduces many Natural phenomenon (real world problem) to differential equation(s).

✓ In this chapter, we will study, the method of obtaining the solution of ordinary differential equation of first order.

❖ DEFINITION: DIFFERENTIAL EQUATION:

✓ An equation which involves differential co-efficient is called a Differential Equation.

\[
\frac{d^2y}{dx^2} + x^2 \frac{dy}{dx} + y = 0
\]

❖ DEFINITION: ORDINARY DIFFERENTIAL EQUATION:

✓ An equation which involves function of single variable and ordinary derivatives of that function then it is called an Ordinary Differential Equation.

\[
\frac{dy}{dx} + y = 0
\]

❖ DEFINITION: PARTIAL DIFFERENTIAL EQUATION:

✓ An equation which involves function of two or more variables and partial derivatives of that function then it is called a Partial Differential Equation.

\[
\frac{\partial y}{\partial x} + \frac{\partial y}{\partial t} = 0
\]

❖ DEFINITION: ORDER OF DIFFERENTIAL EQUATION:

✓ The order of highest derivative which appeared in a differential equation is “Order of D.E”.
\[
\left( \frac{dy}{dx} \right)^2 + \frac{dy}{dx} + 5y = 0 \text{ has order 1.}
\]

**Definition: Degree of Differential Equation:**

- When a D.E. is in a polynomial form of derivatives, the highest power of highest order derivative occurring in D.E. is called a “Degree of D.E.”.

\[
\left( \frac{dy}{dx} \right)^2 + \frac{dy}{dx} + 5y = 0 \text{ has degree 2.}
\]

**Note:**

- To determine the degree, the D.E has to be expressed in a polynomial form in the derivatives. If the D.E. cannot be expressed in a polynomial form in the derivatives, the degree of D.E. is not defined.

**Method – 1: Examples on Order and Degree of Differential Equation**

| C | 1 | Find order and degree of \( \frac{d^2y}{dx^2} = \left[ y + \left( \frac{dy}{dx} \right)^2 \right]^{\frac{1}{4}} \).

SOLUTION OF A DIFFERENTIAL EQUATION:

- A solution or integral or primitive of a differential equation is a relation between the variables which does not involve any derivative(s) and satisfies the given differential equation.

GENERAL SOLUTION (G.S.):

- A solution of a differential equation in which the number of arbitrary constants is equal to the order of the differential equation, is called the General solution or complete integral or complete primitive.

PARTICULAR SOLUTION:

- The solution obtained from the general solution by giving a particular value to the arbitrary constants is called a particular solution.

SINGULAR SOLUTION:

- A solution which cannot be obtained from a general solution is called a singular solution.

LINEAR DIFFERENTIAL EQUATION:

- A differential equation is called “LINEAR DIFFERENTIAL EQUATION” if the dependent variable and every derivatives in the equation occurs in the first degree only and they should not be multiplied together.

Examples:

\[
\frac{d^2y}{dx^2} + x^2 \frac{dy}{dx} + y = 0 \text{ is linear.}
\]

\[
\frac{d^2y}{dx^2} + y \frac{dy}{dx} + y = 0 \text{ is non-linear.}
\]

\[
\frac{d^2y}{dx^2} + x^2 \left(\frac{dy}{dx}\right)^2 + y = 0 \text{ is non-linear.}
\]

A Linear Differential Equation of first order is known as Leibnitz's linear Differential Equation

\[
\frac{dy}{dx} + P(x)y = Q(x) + c \quad \text{or} \quad \frac{dx}{dy} + P(y)x = Q(y) + c
\]
UNIT-4 » Differential Equation of first order

- **TYPE OF FIRST ORDER AND FIRST DEGREE DIFFERENTIAL EQUATION:**
  - Variable Separable Equation
  - Homogeneous Differential Equation
  - Linear(Leibnitz’s) Differential Equation
  - Bernoulli’s Equation
  - Exact Differential Equation

- **PROCEDURE FOR SOLVING D.E. BY VARIABLE SEPARABLE METHOD:**
  1. If a differential equation of type $\frac{dy}{dx} = f(x, y)$.
  2. Convert it into $M(x)dx = N(y)dy$.
  3. Integrate both side to get general solution of a Variable Separable Equation,
     \[ \int M(x)dx = \int N(y)dy + c \]
     Where, $c$ is an arbitrary constant.

- **NOTE:**
  - For convenience, the arbitrary constant can be chosen in any suitable form for the answers.
    e.g. in the form $\log c, \tan^{-1} c, e^c, \sin c$, etc.

- **PROCEDURE TO REDUCE A HOMOGENOUS D.E. IN VARIABLE SEPARABLE EQUATION:**
  - If a differential equation of type $\frac{dy}{dx} = f(x, y)$ can be converted into $\frac{dy}{dx} = \varphi \left( \frac{y}{x} \right)$, then to convert it into variable separable equation follow this procedure:
    1. Take $\frac{y}{x} = t \Rightarrow y = xt$
    2. Differentiate both the sides, w.r.to $x \Rightarrow \frac{dy}{dx} = x \frac{dt}{dx} + t$
    3. Use step-1 and Step-2 in given D.E.
  - Then the given Homogenous D.E. will be converted into variable separable equation.
**METHOD – 2: EXAMPLES ON VARIABLE SEPARABLE METHOD**

| C | 1 | Solve: $9y' y + 4x = 0$.  
**Answer:** $\frac{9}{2}y^2 = -2x^2 + c$ |
|---|---|---|
| C | 2 | Solve: $xy' + y = 0$; $y(2) = -2$.  
**Answer:** $x \cdot y = -4$ |
| H | 3 | Solve $\frac{dy}{dx} = e^{x-y} + x^2 e^{-y}$ by variable separable method.  
**Answer:** $e^y = e^x + \frac{x^3}{3} + c$ |
| H | 4 | Solve: $L \frac{dl}{dt} + RI = 0$, $I(0) = I_0$.  
**Answer:** $I = I_0 \cdot e^{-\frac{Rt}{L}}$ |
| T | 5 | Solve: $(1 + x)ydx + (1 - y)xdy = 0$.  
**Answer:** $\log(xy) + x - y = c$ |
| H | 6 | Solve the following differential equation using variable separable method.  
$3 e^x \tan y dx + (1 + e^x) \sec^2 y dy = 0$  
**Answer:** $(1 + e^x)^3 = \frac{c}{\tan y}$ |
| H | 7 | Solve: $e^x \tan y dx + (1 - e^x) \sec^2 y dy = 0$.  
**Answer:** $(1 - e^x) = c \cdot \tan y$ |
| C | 8 | Solve: $\sin hx \cos y dx = \cos hx \sin y dy$.  
**Answer:** $\cos hx \cos y = c$ |
| T | 9 | Solve: $xy' = y^2 + y$.  
**Answer:** $\frac{y}{y + 1} = x \cdot c$ |
| C | 10 | Solve: $xy \frac{dy}{dx} = 1 + x + y + xy$.  
**Answer:** $y - \log(1 + y) = \log x + x + c$ |
| H | 11 | Solve: $\tan y \frac{dy}{dx} = \sin(x + y) + \sin(x - y)$.  
**Answer:** $\sec y = -2 \cos x + c$ |
| H | 12 | Solve: $1 + \frac{dy}{dx} = e^{x+y}$.  
**Answer:** $-(e^{-x-y}) = x + c$ |

</tbody>
</table>

**PROCEDURE FOR SOLVING D.E. USING LEIBNITZ’S METHOD**

**Type – I:** \( \frac{dy}{dx} + P(x)y = Q(x) \)

1. Find \( P(x) \) and \( Q(x) \) by comparing given D.E. with the above equation.

2. Find \( I.F. = e^{\int P(x) \, dx} \).

3. Find the general solution by solving \( y (I.F.) = \int Q(x) (I.F.) \, dx + c \).

**Type – II:** \( \frac{dx}{dy} + P(y)x = Q(y) \)

1. Find \( P(y) \) and \( Q(y) \) by comparing given D.E. with the above equation.
(2). Find I.F. = \( e^{\int P(y) \, dy} \).

(3). Find the general solution by solving \( x \cdot \text{I.F.} = \int Q(y) \cdot \text{I.F.} \, dy + c \).

**METHOD – 3: EXAMPLES ON LEIBNITZ’S DIFFERENTIAL EQUATION**

| C | 1 | Solve: \( y' + y \sin x = e^{\cos x} \).  
**Answer:** \( y \ e^{-\cos x} = x + c \) |
|---|---|---|
| H | 2 | Solve: \( \frac{dy}{dx} + \frac{1}{x^2} y = 6 \frac{1}{e^x} \).  
**Answer:** \( y \ e^{\frac{1}{x}} = 6 x + c \) |
| H | 3 | Solve: \( y' + 6x^2 y = \frac{e^{-2x^3}}{x^2} \), \( y(1) = 0 \).  
**Answer:** \( y \ e^{2x^3} = - \frac{1}{x} + 1 \) |
| C | 4 | Solve: \( (x + 1) \frac{dy}{dx} - y = (x + 1)^2 e^{3x} \).  
**Answer:** \( \frac{y}{x + 1} = \frac{e^{3x}}{3} + c \) |
| H | 5 | Find the general solution of the differential equation \( \frac{dy}{dx} + y = \sqrt{x} \).  
**Answer:** \( \sqrt{xy} = \frac{1}{3} x^2 + c \) |
| H | 6 | Solve: \( \frac{dy}{dx} + y = x \).  
**Answer:** \( y \ e^{x} = e^{x} x - e^{x} + c \) |
| C | 7 | Solve: \( \frac{dy}{dx} + 2y \tan x = \sin x \).  
**Answer:** \( y \ \sec^2 x = \sec x + c \) |
| H | 8 | Solve: \( x \frac{dy}{dx} + (1 + x)y = x^3 \).  
**Answer:** \( xy \ e^{x} = x^3 e^{x} - 3 x^2 e^{x} + 6 x e^{x} - 6 e^{x} + c \) |
| H | 9 | Solve: \( \frac{dy}{dx} + (\cot x)y = 2\cos x \).  
**Answer:** \( y \cdot \sin x = - \frac{\cos 2x}{2} + c \) |
| H 10 | Solve: \( \frac{dy}{dx} + y \tan x = \sin 2x, y(0) = 0 \).
Answer: \( y \cdot \sec x = -2 \cos x + 2 \) |
|---|---|
| T 11 | Solve: \( \frac{dy}{dx} + \frac{4x}{x^2 + 1}y = \frac{1}{(x^2 + 1)^3} \).
Answer: \( y \cdot (x^2 + 1)^2 = \tan^{-1} x + c \) |
| C 12 | Solve the differential equation \( (1 + y^2)dx = (e^{-\tan^{-1}y} - x)dy \).
Answer: \( x \cdot e^{-\tan^{-1}y} = -\frac{e^{-2\tan^{-1}y}}{2} + c \) |
| C 13 | Solve the differential equation \( (2x^3 + 4y)dx - xdy = 0 \).
Answer: \( \frac{y}{x^4} = -\frac{2}{x} + c \) |

**BERNOUlli's Differential Equation:**

- A differential equation of the form \( \frac{dy}{dx} + P(x)y = Q(x)y^n \) OR \( \frac{dx}{dy} + P(y)x = Q(y)x^n \) is known as Bernoulli's Differential Equation. Where, \( n \in \mathbb{R} - \{0, 1\} \) such differential equation can be converted into linear differential equation and accordingly can be solved.

**Procedure to Reduce Bernoulli's D.E into Linear Differential Equation:**

- **Case 1:** A differential equation of the form \( \frac{dy}{dx} + P(x)y = Q(x)y^n \)
  1. Divide above equation both sides by \( y^n \),
     \[ y^{-n} \frac{dy}{dx} + P(x)y^{1-n} = Q(x) \quad (1) \]
  2. Take \( y^{1-n} = v \)
  3. Differentiate both the sides, w.r.to \( x \),
     \[ (1 - n)y^{-n} \frac{dv}{dx} = \frac{dv}{dx} \Rightarrow y^{-n} \frac{dv}{dx} = \frac{1}{(1 - n)} \frac{dv}{dx} \]
  4. Substitute in Eq.(1), then
     \[ \Rightarrow \frac{1}{(1 - n)} \frac{dv}{dx} + P(x)v = Q(x) \Rightarrow \frac{dv}{dx} + P(x)(1-n)v = Q(x)(1 - n) \]

Which is Linear Differential equation and accordingly can be solved.
**Case 2:** A differential of form \( \frac{dy}{dx} + P(x)f(y) = Q(x)g(y) \)

1. Step-1: Divide above equation both sides by "$g(y)$",

\[
\Rightarrow \frac{1}{g(y)} \frac{dy}{dx} + \frac{P(x)}{g(y)} \frac{f(y)}{g(y)} = Q(x)\quad (2)
\]

2. Take \( \frac{f(y)}{g(y)} = v \)

3. Differentiate both the sides w.r.to \( x \), then Eq\( \textsuperscript{n} \) (2) becomes Linear Differential equation and accordingly can be solved.

**METHOD – 4: EXAMPLES ON BERNOULLI'S DIFFERENTIAL EQUATION**

| C | 1 | Solve: \( \frac{dy}{dx} + \frac{1}{x} y = x^3y^3 \).  
Answer: \( \frac{1}{x^2y^2} = -x^2 + c \) |
|---|---|---|
| T | 2 | Solve the following Bernoulli's equation \( \frac{dy}{dx} + \frac{y}{x} = \frac{y^2}{x^2} \).  
Answer: \( \frac{1}{xy} = \frac{1}{2x^2} + c \) |
| H | 3 | Solve: \( \frac{dy}{dx} + y = -\frac{x}{y} \).  
Answer: \( y^2e^{2x} = -xe^{2x} + \frac{e^{2x}}{2} + c \) |
| H | 4 | Solve: \( e^y \frac{dy}{dx} + e^y = e^x \).  
Answer: \( e^{x+y} = \frac{e^{2x}}{2} + c \) |
| H | 5 | Solve: \( \frac{dy}{dx} + \frac{1}{x} = \frac{e^y}{x^2} \).  
Answer: \( \frac{e^{-y}}{x} = \frac{1}{2x^2} + c \) |
| C | 6 | Solve: \( \frac{dy}{dx} - \frac{\tan y}{1+x} = (1+x)e^x \sec y \).  
Answer: \( \frac{\sin y}{1+x} = e^x + c \) |
UNIT-4 » Differential Equation of first order

| C  | 7   | Solve: $\sec^2 y \frac{dy}{dx} + x \tan y = x^3$.  
Answer: $\tan y e^{\frac{x^2}{2}} = 2x^2 e^{\frac{x^2}{2}} - 4e^\frac{x^2}{2} + c$  |
| H  | 8   | Solve: $\frac{dy}{dx} + x \sin 2y = x^3 \cos^2 y$.  
Answer: $e^{x^2} \tan y = \frac{x^2 e^{x^2}}{2} - \frac{e^{x^2}}{2} + c$  |
| H  | 9   | Solve: $\frac{dy}{dx} - 2y \tan x = y^2 \tan^2 x$.  
Answer: $\frac{\sec^2 x}{y} = -\frac{\tan^3 x}{3} + c$  |
| C  | 10  | Solve: $(x^3 y^2 + x y) dx = dy$.  
Answer: $\frac{x^2}{y} = 2e^{\frac{x^2}{2}} - x^2 e^{\frac{x^2}{2}} + c$  |
| T  | 11  | Solve: $x \frac{dy}{dx} + y = y^2 \log x$.  
Answer: $\frac{1}{x y} = \frac{\log x}{x} + \frac{1}{x} + c$  |
| C  | 12  | Solve: $\frac{dy}{dx} = \frac{y^3}{e^{2x} + y^2}$.  
Answer: $-e^{-2x} y^2 = 2 \log y + c$  |

**EXACT DIFFERENTIAL EQUATION:**

✓ A differential equation of the form $M(x,y)dx + N(x,y)dy = 0$ is said to be Exact Differential Equation.

✓ The necessary and sufficient condition for differential equation to be exact is $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$.

✓ Where first order continuous partial derivative of $M$ and $N$ must be exist at all points of $f(x,y)$.

**PROCEDURE TO SOLVE EXACT DIFFERENTIAL EQUATION:**

✓ If a differential equation of the form $M(x,y)dx + N(x,y)dy = 0$.

(1) Find $M(x,y)$ and $N(x,y)$ by comparing the given D.E. with above equation.
(2). Find $\frac{\partial M}{\partial y}$ and $\frac{\partial N}{\partial x}$

(3). If $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$ then the given D.E. is Exact.

(4). Find the general solution by solving

$$\int M \, dx + \int \left( \text{terms of N free from x} \right) dy = c$$

Where, $c$ is an arbitrary constant.

**METHOD – 5: EXAMPLES ON EXACT DIFFERENTIAL EQUATION**

| H | 1 | Solve: $(x^3 + 3xy^2)dx + (y^3 + 3x^2y)dy = 0.$
Answer: $\frac{x^4}{4} + \frac{3x^2y^2}{2} + \frac{y^4}{4} = c$ |
|---|---|---|
| C | 2 | Check whether the given differential equation is exact or not
$(x^4 - 2xy^2 + y^4)dx - (2x^2y - 4xy^3 + siny)dy = 0.$
Answer: Exact, $\frac{x^5}{5} - x^2y^2 + xy^4 + cosy = c$ |
| H | 3 | Solve: $(x^2 + y^2)dx + 2xydy = 0.$
Answer: $\frac{x^3}{3} + y^2x = c$ |
| H | 4 | Solve: $2x \, y \, dx + x^2 \, dy = 0.$
Answer: $x^2y = c$ |
| C | 5 | Solve: $\frac{dy}{dx} = \frac{x^2 - x - y^2}{2xy}.$
Answer: $\frac{x^3}{3} - \frac{x^2}{2} - xy^2 = c$ |
| H | 6 | Solve: $ye^x dx + (2y + e^x)dy = 0.$
Answer: $ye^x + y^2 = c$ |
| H | 7 | Solve: $(e^y + 1) \cos x \, dx + e^y \sin x \, dy = 0.$
Answer: $(e^y + 1) \sin x = c$ |

**A FIRST ORDER NON-LINEAR DIFFERENTIAL EQUATION BUT NOT OF FIRST DEGREE**

✓ A differential equation of first order but of higher degree is, of the form \( f(x, y, y') = 0 \) or \( f(x, y, p) = 0 \) where \( \frac{dy}{dx} = y' = p \) and degree of p is more than one.

✓ For Example: \( \left( \frac{dy}{dx} \right)^2 (\sin x + e^x) + 3y \left( \frac{dy}{dx} \right) + 4y^2 = 0 \) is of order one and degree 2.

✓ The general form of a first order differential equation of degree n is

\[
p^n + a_1(x, y)p^{n-1} + a_2(x, y)p^{n-2} + \cdots + a_{n-1}(x, y)p + a_n(x, y) = 0 \quad \text{... (1)}
\]

✓ Here, coefficients \( a_1(x, y), a_2(x, y), \ldots, a_n(x, y) \) are all functions of x and y.

✓ Equation (1) can be solved by reducing it into first order and first degree equation, by

(1). Equation solving for \( p \).

(2). Equation solving for \( y \).

(3). Equation solving for \( x \).

**EQUATIONS SOLVABLE FOR p**

✓ If L.H.S. of eq. (1), which is an \( n^{th} \) degree polynomial in \( p \), can be factorised into the form

\[
(p - b_1)(p - b_2) \cdots (p - b_n) = 0
\]
UNIT-4 » Differential Equation of first order

Where, \( b_1, b_2, ..., b_n \) are all functions of \( x \) and \( y \).

✓ Therefore, \( p = b_1, p = b_2, ..., p = b_n \)

\[ \frac{dy}{dx} = b_1(x, y), \frac{dy}{dx} = b_2(x, y), ..., \frac{dy}{dx} = b_n(x, y) \]

Solving these \( n \) equations, we obtain \( f_1(x, y, c) = 0, f_2(x, y, c) = 0, ..., f_n(x, y, c) = 0 \).

★ PROCEDURE FOR EQUATIONS SOLVABLE FOR \( p \)

(1). Take \( \frac{dy}{dx} = p \).

(2). Factorize the equation.

(3). Equate all the factors with zero.

(4). Find the solution.

METHOD – 6: EXAMPLES ON EQUATION SOLVABLE FOR \( p \)

| C | 1 | Solve: \( p^2 + px + py + xy = 0 \).  
  |   | \textbf{Answer:} \((2y + x^2 - c)(x + \ln |y| - c)\) |
| H | 2 | Solve: \( p^2 y + p(x - y) - x = 0 \).  
  |   | \textbf{Answer:} \((y - x - c) \left(\frac{y^2}{2} + \frac{x^2}{2} - c\right) = 0\) |
| H | 3 | Solve: \( \left(\frac{dy}{dx}\right)^2 - 5y + 6 = 0 \).  
  |   | \textbf{Answer:} \((y - 3x - c)(y - 2x - c) = 0\) |
| C | 4 | Solve: \( x^2 \left(\frac{dy}{dx}\right)^2 + xy \frac{dy}{dx} - 6y^2 = 0 \).  
  |   | \textbf{Answer:} \((yx^2 - c)(y - cx^2) = 0\) |
| H | 5 | Solve: \( x + yp^2 = p(1 + xy) \).  
  |   | \textbf{Answer:} \(\left(y - \frac{x^2}{2} - c\right)\left(\frac{y^2}{2} - x - x\right) = 0\) |
| T | 6 | Solve: \( 4y^2 p^2 + 2pxy(3x + 1) + 3x^2 = 0 \).  
  |   | \textbf{Answer:} \((2y^2 + x^2 - 2c)(y^2 + x^3 - c) = 0\) |
EQUATIONS SOLVABLE FOR y

✓ The given equation is \( f(x, y, p) = 0 \) .... (1) Solving it for \( y \),

(1). Let \( y = F(x, p) \)

(2). Differentiate Eq. (1) w.r.t. \( x \), gives

\[
\frac{dy}{dx} = \frac{\partial F}{\partial x} \cdot 1 + \frac{\partial F}{\partial p} \frac{dp}{dx} \Rightarrow p = \Phi(x, p, \frac{dp}{dx})
\]

(3). Solve the above equation and get a relation of type \( \psi(x, p, c) = 0 \)

(4). Eliminate \( p \) between \( f(x, y, p) = 0 \) and \( \psi(x, p, c) = 0 \), which will give you the required solution.

✓ When the elimination of \( p \) is not possible then we obtain the values of \( x \) and \( y \) in terms of \( p \) as a parameter and these together give us the required solution.

METHOD – 7: EXAMPLES ON EQUATION SOLVABLE FOR y

| C  | 1 | Solve: \( 3x^4 \left( \frac{dy}{dx} \right)^2 - x \left( \frac{dy}{dx} \right) - y = 0 \).
Answer: \( xy = c(3cx - 1) \) |
|----|---|---|
| H  | 2 | Solve: \( y = x + a \tan^{-1} p \).
Answer: \( x = \frac{a}{2} \ln \frac{p - 1}{\sqrt{p^2 + 1}} - \frac{a}{2} \tan^{-1} p + c \)
\[
y = \frac{a}{2} \ln \frac{p - 1}{\sqrt{p^2 + 1}} - \frac{a}{2} \tan^{-1} p + c
\] |
| H  | 3 | Solve: \( p^3 + p = e^y \).
Answer: \( x = -\frac{1}{p} + 2 \tan^{-1} p + c \)
\[
y = \ln p + \ln(p^2 + 1)
\] |
| C  | 4 | Solve: \( x = y + a \ln p \).
Answer: \( x = -a \ln \left( \frac{p - 1}{p} \right) + c \)
\[
y = c - a \ln(p - 1)
\] |
SOLVABLE FOR x

The given equation is \( f(x, y, p) = 0 \) .... ... (1) Solving it for \( y \),

(1). Let \( x = F(y, p) \)

(2). Differentiate Eq. (1) w.r.t \( y \), gives

\[
\frac{dx}{dy} = \frac{1}{p} = \frac{\partial F}{\partial y} \cdot 1 + \frac{\partial F}{\partial p} \frac{dp}{dy} \Rightarrow p = \phi \left( x, p, \frac{dp}{dx} \right)
\]

(3). Suppose \( y(x, p, c) = 0 \)

(4). Eliminate \( p \) between \( x = F(y, p) \) and \( y(x, p, c) = 0 \), which will give you the required solution.

When the elimination of \( p \) is not possible then we can express \( x = x(p, c) \) and \( y = y(p, c) \) which will be the parametric representation of the solution.

CLAIRAUT’S EQUATION

An equation of the form

\[
y = x \frac{dy}{dx} + f \left( \frac{dy}{dx} \right) \quad \text{or} \quad y = xp + f(p)
\]
is called Clairaut’s equation, where \( p = \frac{dy}{dx} \) and \( f \) is a known function of \( p \).

### PROCEDURE FOR SOLVINGCLAIRAUT’S EQUATION

1. The given equation is \( f(x, y, p) = 0 \) .... (1) Solving it for \( y \),
2. Convert into the form \( y = xp + f(p) \).
3. For Complete Solution, replace “\( p \)” by “\( c \)”.
4. For Singular Solution, differentiate complete solution with respect to \( c \).
5. Find value of \( c \) and substitute the value of \( c \) into complete solution.

### METHOD – 9: EXAMPLES ON CLAIRAUT’S EQUATION

UNIT-5 » ORDINARY DIFFERENTIAL EQUATIONS OF HIGHER ORDERS

❖ INTRODUCTION:

✓ Many engineering problems such as Oscillatory phenomena, Bending of beams, etc. leads to the formulation and solution of Linear Ordinary Differential equations of second and higher order.

✓ In this chapter we will study, the method of obtaining the solution of Linear Ordinary Differential equations (homogeneous and nonhomogeneous) of second and higher order.

❖ HIGHER ORDER LINEAR DIFFERENTIAL EQUATION:

✓ A linear differential equation with more than one order is known as Higher Order Linear Differential Equation.

✓ A general linear differential equation of the \( n \)th order is of the form

\[
P_0 \frac{d^n y}{dx^n} + P_1 \frac{d^{n-1} y}{dx^{n-1}} + P_2 \frac{d^{n-2} y}{dx^{n-2}} + \cdots + P_n y = R(x) \cdots \cdots (A)
\]

Where \( P_0, P_1, P_2, \ldots \) are functions of \( x \) and \( P_0 \neq 0 \).

❖ HIGHER ORDER LINEAR DIFFERENTIAL EQUATION WITH CONSTANT CO-EFFICIENT:

✓ The \( n \)th order linear differential equation with constant co-efficient is

\[
a_0 \frac{d^n y}{dx^n} + a_1 \frac{d^{n-1} y}{dx^{n-1}} + a_2 \frac{d^{n-2} y}{dx^{n-2}} + \cdots + a_n y = R(x) \cdots \cdots (B)
\]

Where \( a_0, a_1, a_2, \ldots \) are constants and \( a_0 \neq 0 \).

❖ NOTATIONS:

✓ Eq. (B) can be written in operator form by taking \( D \equiv \frac{d}{dx} \) as below,

\[
a_0 D^n y + a_1 D^{n-1} y + a_2 D^{n-2} y + \cdots + a_n y = R(x) \cdots \cdots (C) \quad \text{OR}
\]

\[
[f(D)] y = R(x) \quad \cdots \cdots (D)
\]
UNIT-5  »  **Ordinary differential Equations of Higher Orders**  

**NOTE:**

✓ An nth order linear differential equation has n linear independent solution.

**AUXILIARY EQUATION:**

✓ The auxiliary equation for nth order linear differential equation $a_0D^n y + a_1D^{n-1} y + a_2D^{n-2} y + \cdots + a_n y = R(x)$ is derived by replacing $D$ by $m$ and equating with 0 i.e.

$$a_0m^n + a_1m^{n-1} + a_2m^{n-2} + \cdots + a_n = 0$$

**COMPLIMENTARY FUNCTION (C.F. - $y_c$):**

✓ A general solution of $[ f(D) ] y = 0$ is called complimentary function of $[ f(D) ] y = R(x)$.

**PARTIAL INTEGRAL (P.I. - $y_p$):**

✓ A particular integral of $[ f(D) ] y = R(x)$ is $y = \frac{1}{f(m)}R(x)$.

**GENERAL SOLUTION [$y(x)$] OF HIGHER ORDER LINEAR DIFFERENTIAL EQUATION:**

✓ G.S. = C.F + P.I. i.e. $y(x) = y_c + y_p$

**NOTE:**

✓ In case of higher order homogeneous differential equation, complimentary function is same as general solution.

**FORMULAE:**

$$a^3 - b^3 = (a - b)(a^2 + ab + b^2)$$

$$a^3 + b^3 = (a + b)(a^2 - ab + b^2)$$

$$a^3 - b^3 = (a - b)(a^2 + ab + b^2)$$

$$a^3 + b^3 = (a + b)(a^2 - ab + b^2)$$

**PROCEDURE FOR FINDING G.S.(C.F.) OF HOMOGENEOUS LINEAR ODE WITH CONSTANT CO-EFFICIENTS:**

1. Consider, $a_0D^n y + a_1D^{n-1} y + a_2D^{n-2} y + \cdots + a_n y = R(x)$

2. The Auxiliary equation is $a_0m^n y + a_1m^{n-1} y + a_2m^{n-2} y + \cdots + a_n y = 0$

3. Find roots of auxiliary equation i.e. $m_1, m_2, m_3, \ldots \ldots$

4. Write down the C.F. as per following table:

Answer: \( y = e^{\frac{k}{\sqrt{2}}} \left\{ c_1 \cos \frac{k}{\sqrt{2}} x + c_2 \sin \frac{k}{\sqrt{2}} x \right\} + e^{-\frac{k}{\sqrt{2}}} \left\{ c_3 \cos \frac{k}{\sqrt{2}} x + c_4 \sin \frac{k}{\sqrt{2}} x \right\} \) |

| **PARTICULAR INTEGRAL** |

- Consider the differential equation \( a_0 D^n y + a_1 D^{n-1} y + a_2 D^{n-2} y + \cdots + a_n y = R(x) \)

  \[ \Rightarrow f(D)y = R(x) \]

  \[ \therefore \text{Particular Integral} = y_p = \frac{1}{f(D)} R(x) \]
METHOD OF FINDING THE PARTICULAR INTEGRAL:

- There are many methods of finding the particular integral \( \frac{1}{f(D)} R(x) \), we shall discuss following four main methods:
  
  1. General Methods
  2. Direct or Short-cut Methods involving operators
  3. Method of Undetermined Co-efficient
  4. Method of Variation of parameters

GENERAL METHODS:

Particular Integral may be obtained by following two ways:

1. Method of Factors:

   - The operator \( \frac{1}{f(D)} \) may be factorized into \( n \) linear factors; then the P.I. will be
     \[
     P.I. = \frac{1}{f(D)} R(x) = \frac{1}{(D - m_1)(D - m_2) \ldots \ldots \ldots (D - m_n)} R(x)
     \]

   - Now, we know that,
     \[
     \frac{1}{D - m_n} R(x) = e^{m_n x} \int R(x) e^{-m_n x} dx
     \]

   - On operating with the first symbolic factor, beginning at the right, the particular integral will have form
     \[
     P.I. = \frac{1}{(D - m_1)(D - m_2) \ldots \ldots \ldots (D - m_{n-1})} e^{m_n x} \int R(x) e^{-m_n x} dx
     \]

   - Then, on operating with the second and remaining factors in succession, taking them from right to left, one can find the desired particular integral.

2. Method of Partial Fractions:

   - The operator \( \frac{1}{f(D)} \) may be factorized into \( n \) linear factors; then the P.I. will be
     \[
     P.I. = \frac{1}{f(D)} R(x) = \left( \frac{A_1}{D - m_1} + \frac{A_2}{D - m_2} + \ldots + \frac{A_n}{D - m_n} \right) R(x)
     \]
\[ A_1 \frac{1}{D-m_1} R(x) + A_2 \frac{1}{D-m_2} R(x) + \cdots + A_n \frac{1}{D-m_n} R(x) \]

Using \( \frac{1}{D-m_n} R(x) = e^{m_n x} \int R(x) e^{-m_n x} \, dx \), we get

P. I. = \( A_1 e^{m_1 x} \int R(x) e^{-m_1 x} \, dx + A_2 e^{m_2 x} \int R(x) e^{-m_2 x} \, dx + \cdots + A_n e^{m_n x} \int R(x) e^{-m_n x} \, dx \)

✓ Out of these two methods, this (2nd) method is generally preferred.

**DIRECT OR SHORTCUT METHOD:**

✓ **Case-1:** \( R(x) = e^{ax} \)

If \( f(a) \neq 0 \), \( P. I. = \frac{1}{f(D)} e^{ax} = \frac{1}{f(a)} e^{ax} \)

If \( f(a) = 0 \), \( P. I. = \frac{1}{f(D)} e^{ax} = \frac{x}{f'(a)} e^{ax} \) where \( f'(a) \neq 0 \)

If \( f^{n-1}(a) = 0 \), \( P. I. = \frac{1}{f(D)} e^{ax} = \frac{x^n}{f^n(a)} e^{ax} \) where \( f^n(a) \neq 0 \)

✓ **Note:** If \( R(x) = \sinh x \) or \( \cosh x \) or constant, then **Case-1** is preferable.

✓ **Case-2:** \( R(x) = \sin(ax + b) \)

\( P. I. = \frac{1}{f(D^2)} \sin(ax + b) \)

If \( f(-a^2) \neq 0 \), \( P. I. = \frac{1}{f(-a^2)} \sin(ax + b) \)

If \( f(-a^2) = 0 \), \( P. I. = \frac{x}{f'(-a^2)} \sin(ax + b) \), where \( f'(-a^2) \neq 0 \)

If \( f''(-a^2) = 0 \), \( P. I. = \frac{x^2}{f'''(-a^2)} \sin(ax + b) \), where \( f''(-a^2) \neq 0 \) and so on...

✓ **Case-3:** \( R(x) = \cos(ax + b) \)

\( P. I. = \frac{1}{f(D^2)} \cos(ax + b) \)

If \( f(-a^2) \neq 0 \), \( P. I. = \frac{1}{f(-a^2)} \cos(ax + b) \)
If \( f(-a^2) = 0 \), P. I. = \( \frac{x}{f'(a^2)} \cos(ax + b) \), where \( f'(a^2) \neq 0 \)

If \( f'(a^2) = 0 \), P. I. = \( \frac{x^2}{f''(a^2)} \cos(ax + b) \), where \( f''(a^2) \neq 0 \) and so on ...

✓ **Case-4**: \( R(x) = x^m \) = polynomial of degree \( m \); \( m > 0 \)

P. I. = \( \frac{1}{f(D)} x^m \)

In this case, convert \( f(D) \) in the form of \( 1 + \phi(D) \) or \( 1 - \phi(D) \) form.

P. I. = \( \frac{1}{1 + \phi(D)} x^m = [1 + \phi(D)]^{-1} x^m = \{1 - \phi(D) + [\phi(D)]^2 - \ldots\} x^m \)

✓ **Case-5**: \( R(x) = e^{ax} V(x) \), where \( V(x) \) is a function of \( x \).

P. I. = \( \frac{1}{f(D)} e^{ax} V(x) = e^{ax} \frac{1}{f(D + a)} V(x) \)

✓ **NOTE**:

\[ \frac{1}{1 + x} = (1 + x)^{-1} = 1 - x + x^2 - \ldots \quad \text{and} \quad \frac{1}{1 - x} = (1 - x)^{-1} = 1 + x + x^2 + \ldots \]

✓ **PROCEDURE FOR FINDING G.S. OF NON-HOMOGENEOUS LINEAR ODE WITH CONSTANT CO-EFFICIENTS**:

(1). Start with the Auxiliary equation \( a_0 m^n y + a_1 m^{n-1} y + a_2 m^{n-2} y + \ldots + a_n y = 0 \)

(2). Find roots of auxiliary equation \( \text{i.e.} \quad m_1, m_2, m_3, \ldots, \ldots \)

(3). Write down the C.F. as per table of method-1.

(4). Find out P.I. as per above case (1 to 5).

(5). Write the G.S. = C.F. + P.I.

\[ (D^4 - 16)y = e^{2x} + x^4. \]

**Answer:**
\[ y = c_1 e^{2x} + c_2 e^{-x} + c_3 \cos 2x + c_4 \sin 2x + \frac{x}{32} e^{2x} - \frac{x^4}{16} - \frac{3}{32} \]

\[ \frac{d^4y}{dt^4} - 2 \frac{d^2y}{dt^2} + y = \cos t + e^{2t} + e^t. \]

**Answer:**
\[ y = (c_1 + c_2 t)e^{-t} + (c_3 + c_4 t)e^t + \left( \frac{\cos t}{4} + \frac{e^{2t}}{9} + \frac{t^2 e^t}{8} \right) \]

\[ (D^2 + 16)y = x^4 + e^{3x} + \cos 3x. \]

**Answer:**
\[ y = c_1 \cos 4x + c_2 \sin 4x + \frac{1}{16} \left( x^4 - \frac{3x^2}{4} + \frac{3}{32} \right) + \frac{e^{3x}}{25} + \frac{\cos 3x}{7} \]

\[ (D^2 - 1)y = xe^x. \]

**Answer:**
\[ y = c_1 e^x + c_2 e^{-x} + \frac{1}{4} e^x(x^2 - x) \]

**METHOD OF UNDETERMINED CO-EFFICIENTS:**

- This method can be used to find the particular integral only if linearly independent derivative of \( R(x) \) are finite in number i.e. \( R(x) \) can be of the form \( k, x^n, e^{ax}, \sin ax, \cos ax \) and combination of this terms; where \( k \) and \( a \) are constant.

- For example: If \( R(x) = \frac{1}{x} \) or \( \tan x \) or \( \sec x \) etc., then this method is not applicable.

**TRIAL SOLUTION FROM R(X) FOR P.I.:**

<table>
<thead>
<tr>
<th>Sr. No.</th>
<th>RHS of f(D)y = R(x)</th>
<th>Form of Trial Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>1)</td>
<td>R(x) = e^{ax}</td>
<td>( Y_p = Ae^{ax} )</td>
</tr>
</tbody>
</table>

**Example**
\[ R(x) = e^{2x} \]
\[ R(x) = e^{2x} - 3e^{-x} \]
\[ Y_p = Ae^{2x} \]
\[ Y_p = Ae^{2x} + Be^{-x} \]
### Sr. No. | RHS of \( f(D)y = R(x) \) | Form of Trial Solution
--- | --- | ---
2 | \( R(x) = \sin ax \) or \( R(x) = \cos ax \) | \( Y_p = A \sin ax + B \cos ax \)
Example | \( R(x) = \cos 3x \) \( R(x) = 2 \sin(4x - 5) \) | \( Y_p = A \sin 3x + B \cos 3x \) \( Y_p = A \sin(4x - 5) + B \cos(4x - 5) \)
3 | \( R(x) = a + bx + cx^2 + dx^3 \) \( R(x) = ax^2 + bx \) \( R(x) = ax + b \) \( R(x) = c \) | \( Y_p = A + Bx + Cx^2 + Dx^3 \) \( Y_p = A + Bx + Cx^2 \) \( Y_p = A + Bx \) \( Y_p = A \)
4 | \( R(x) = e^{ax} \sin bx \) or \( R(x) = e^{ax} \cos bx \) | \( Y_p = e^{ax}(A \sin bx + B \cos bx) \)
5 | \( R(x) = xe^{ax} \) \( R(x) = x^2e^{ax} \) | \( Y_p = e^{ax}(A + Bx) \) \( Y_p = e^{ax}(A + Bx + Cx^2) \)
6 | \( R(x) = x \sin ax \) \( R(x) = x^2 \cos ax \) | \( Y_p = \sin ax (A + Bx) + \cos ax \) \( Y_p = \sin ax (A + Bx + Cx^2) + \cos ax (D + Ex + Fx^2) \)

**NOTE:**

- Before assuming trial solution for particular integral (P.I) it is necessary to compare the terms of \( R(x) \) with Complementary function (C.F.).
- While comparing the terms following cases arise.
  - **Case - 1:** If no terms of \( R(x) \) present in C.F. then P.I. is assumed from the table depending on the nature of \( R(x) \).
  - **Case - 2:** If a term \( u \) of \( R(x) \) is also present in C.F. then we multiply the corresponding term \( u \) by \( x \) while assuming trial solution for P.I.
  - **Case - 3:** If a term say \( x^n u \) of \( R(x) \) is also present in C.F. then we multiply the corresponding term \( x^n u \) by \( x^n \) while assuming trial solution for P.I.
PROCEDURE FOR FINDING G.S. BY METHOD OF UNDETERMINED COEFFICIENTS:

1. Find C.F. as per table of method-1.
2. Assume the trial solution for P.I. from the above three cases according to the nature of R(x).
3. Find P.I. by using the trial solution in given differential equation.
4. Write the G.S. = C.F. + P.I.

H 8 Solve the following differential equation using the method of undetermined coefficient:
\[
\frac{d^2y}{dx^2} + 2 \frac{dy}{dx} + 4y = 2x^2 + 3e^{-x}.
\]
Answer: \(y = e^{-x}(c_1\cos3x + c_2\sin3x) - \frac{1}{2}x + \frac{1}{2}x^2 + e^{-x}\)

C 9 Use the method of undetermined coefficients to solve the differential equation \(y'' - 2y' + y = x^2e^x\).
Answer: \(y = (c_1 + x\ c_2)e^x + \frac{x^4e^x}{12}\)

**EXISTANCE AND UNIQUENESS OF SOLUTIONS:**

For \(\frac{d^n y}{dx^n} + p_1(x) \frac{d^{n-1} y}{dx^{n-1}} ... p_{n-1}(x) \frac{dy}{dx} + p_n(x)y = R(x)\)

✓ If \(p_1, p_2, ..., p_n\) and \(R(x)\) are continuous functions on an open interval \(I\) such that \(x_0 \in I\) & initial conditions are \(y(x_0) = y_0, y'(x_0) = y'_0\), then above ODE has a unique solution \(y = \phi(x)\) throughout the interval \(I\).

**LINEAR DEPENDENCE AND INDEPENDENCE OF SOLUTIONS:**

✓ Two solutions \(y_1(x)\) and \(y_2(x)\) of second order linear differential equations with constant coefficient are said to be

(1). Linearly independent if \(k_1y_1(x) + k_2y_2(x) = 0 \iff k_1 = k_2 = 0\)

(2). Linearly dependent if \(k_1y_1(x) + k_2y_2(x) = 0 \iff k_1 \neq 0 \text{ or/and } k_2 \neq 0\)

✓ If \(y_1\) and \(y_2\) are linearly independent, then \(y_1\) and \(y_2\) cannot be expressed in terms of each other.

**WRONSKIAN:**

✓ Wronskian of the \(n\) functions \(y_1, y_2, ..., y_n\) is defined and denoted by the determinant
\( W(y_1, y_2, \ldots, y_n) = \begin{vmatrix} y_1 & y_2 & \ldots & y_n \\ y_1' & y_2' & \ldots & y_n' \\ y_1'' & y_2'' & \ldots & y_n'' \\ \vdots & \vdots & \ddots & \vdots \\ y_1^{(n-1)} & y_2^{(n-1)} & \ldots & y_n^{(n-1)} \end{vmatrix} \)

**THEOREM:**

- Let \( y_1, y_2, \ldots, y_n \) be differentiable functions defined on some interval \( I \) then \( y_1, y_2, \ldots, y_n \) are linearly independent on \( I \) if and only if \( W(y_1, y_2, \ldots, y_n) \neq 0 \) at least one value of \( x \in I \).

- If \( W(y_1, y_2, \ldots, y_n) = 0 \), then no conclusion can be made about linearly dependent or independent of these functions.

- If \( y_1, y_2, \ldots, y_n \) are linearly dependent on \( I \) then \( W(y_1, y_2, \ldots, y_n) = 0 \) for all \( x \in I \).

**METHOD OF VARIATION OF PARAMETERS:**

- The process of replacing the parameters by functions is called method of variation of parameters.

**PROCEDURE FOR FINDING G.S. BY METHOD OF VARIATION OF PARAMETERS:**

- For **second** order differential equation

\( (1) \). Find the C.F. = \( c_1y_1 + c_2y_2 \).
UNIT-5 » Ordinary differential Equations of Higher Orders  [89]

(2). Find the Wronskian of \( y_1, y_2 \) as \( W = \begin{vmatrix} y_1 & y_2 \\ y'_1 & y'_2 \end{vmatrix} \).

(3). Find \( u(x) \) and \( v(x) \) by evaluating the integrals

\[
u(x) = \int \frac{-y_2 R(x)}{W} \, dx, \quad v(x) = \int \frac{y_1 R(x)}{W} \, dx.
\]

(4). Find the P.I. = \( u(x)y_1 + v(x)y_2 \).

(5). Write the general solution \( y = \text{C.F.} + \text{P.I.} \)

✓ For third order differential equation

(1). Find the C.F. = \( c_1y_1 + c_2y_2 + c_3y_3 \).

(2). Find the Wronskian of \( y_1, y_2, y_3 \) as \( W = \begin{vmatrix} y_1 & y_2 & y_3 \\ y'_1 & y'_2 & y'_3 \\ y''_1 & y''_2 & y''_3 \end{vmatrix} \).

(3). Find \( A(x), B(x) \) and \( C(x) \) by evaluating the integrals

\[
A(x) = \int (y_2y'_3 - y_3y'_2) \frac{R(x)}{W} \, dx
\]

\[
B(x) = \int (y_3y'_1 - y_1y'_3) \frac{R(x)}{W} \, dx
\]

\[
C(x) = \int (y_1y'_2 - y_2y'_1) \frac{R(x)}{W} \, dx
\]

(4). Find the P.I. = \( A(x)y_1 + B(x)y_2 + C(x)y_3 \).

(5). Write the general solution \( y = \text{C.F.} + \text{P.I.} \)

Answer: \(y = c_1 \cos ax + c_2 \sin ax - \frac{x \cos ax}{a} + \frac{1}{a^2} \sin ax \log(|\sin ax|)\)

H 15 Solve the following differential equation \(\frac{d^2y}{dx^2} + y = \sin x\) using the method of variation of parameters.

Answer: \(y = c_1 \cos x + c_2 \sin x - \frac{\cos x}{2} + \frac{\cos x \sin 2x}{4} - \frac{\sin x \cos 2x}{4}\)

C 16 Solve: \(\frac{d^3y}{dx^3} + \frac{dy}{dx} = \csc x\)

Answer: \(y = c_1 + c_2 \cos ax + c_3 \sin ax + \log(|\csc x - \cot x|) - \cos x \{\log(|\sin x|)\} - x \sin x\)

C 17 Solve the differential equation \(x^2 \frac{d^2y}{dx^2} - 2x \frac{dy}{dx} + 2y = x^3 \cos x\) by using the method of variation of parameters.

Answer: \(y = c_1 x^2 + c_2 x - x \cos x\)

\[\text{S 2019 (7)}\]

**CAUCHY – EULER EQUATIONS:**

- An equation of the form

\[x^n \frac{d^n y}{dx^n} + a_1 x^{n-1} \frac{d^{n-1} y}{dx^{n-1}} + a_2 x^{n-2} \frac{d^{n-2} y}{dx^{n-2}} + \cdots + a_{n-1} x \frac{dy}{dx} + a_n y = R(x)\]

is called Cauchy’s homogeneous linear equation. Where \(a_1, a_2, \ldots, a_n\) are constants and \(R(x)\) is a function of \(x\).

**PROCEDURE TO SOLVE HOMOGENEOUS CAUCHY EULER EQUATIONS:**

1. Replace following terms in given differential equation to convert Cauchy Euler Equation into Linear Differential Equation.

\[x \frac{dy}{dx} = Dy, \quad x^2 \frac{d^2y}{dx^2} = D(D - 1)y, \quad x^3 \frac{d^3y}{dx^3} = D(D - 1)(D - 2)y, \ldots \]

where \(D = \frac{d}{dz}\)

2. Obtained Linear Differential Equation with constant co-efficient.

3. Find C.F.
(4). Put \( z = \log x \) and get the general solution.

**PROCEDURE TO SOLVE NON-HOMOGENEOUS CAUCHY EULER EQUATIONS:**

(1). Replace following terms in given differential equation to convert Cauchy Euler Equation into Linear Differential Equation.

Let, \( x = e^z \)

\[
x \frac{dy}{dx} = Dy, \quad x^2 \frac{d^2y}{dx^2} = D(D - 1)y, \quad x^3 \frac{d^3y}{dx^3} = D(D - 1)(D - 2)y, \ldots \ldots
\]

where \( D = \frac{d}{dz} \)

(2). Obtained Linear Differential Equation with constant co-efficient.

(3). Find C.F.

(4). Find P.I.

(5). Write the general solution \( y = \text{C.F.} + \text{P.I.} \)

(6). Put \( z = \log x \) and get the general solution.

**METHOD – 6: EXAMPLES ON EXAMPLE ON CAUCHY EULER EQUATIONS**

**HOMOGENEOUS LINEAR DIFFERENTIAL EQUATION:**

Reduction of order method for Linear second order O.D.E.

1. Convert given D.E. into $\frac{d^2y}{dx^2} + P(x) \frac{dy}{dx} + Q(x)y = 0$ and find $P(x)$ & $Q(x)$. 

(2). Find U.

\[ U = \frac{1}{y_1^2} e^{-\int P \, dx} \]

(3). Find V.

\[ V = \int U \, dx \]

(4). Second solution \( y_2 = V \cdot y_1 \)

(5). General solution is \( y = c_1 y_1 + c_2 y_2 \).

UNIT - 6A – INTRODUCTION TO SOME SPECIAL FUNCTIONS

❖ INTRODUCTION:

✓ Special functions are particular mathematical functions which have some fixed notations due to their importance in mathematics. In this Unit we will study various type of special functions such as Gamma function, Beta function, Error function, Dirac Delta function etc. These functions are useful to solve many mathematical problems in advanced engineering mathematics.

❖ BETA FUNCTION:

✓ If \( m > 0, n > 0 \), then Beta function is defined by the integral

\[
B(m, n) = \int_0^1 x^{m-1} (1 - x)^{n-1} \, dx
\]

And is denoted by \( \beta(m, n) \) or \( B(m, n) \).

❖ PROPERTIES:

(1). Beta function is a symmetric function i.e. \( B(m, n) = B(n, m) \), where \( m > 0, n > 0 \).

(2). \( B(m, n) = 2 \int_0^{\pi/2} \sin^{2m-1} \theta \cos^{2n-1} \theta \, d\theta \)

(3). \( \int_0^{\pi/2} \sin^p \theta \cos^q \theta \, d\theta = \frac{1}{2} \cdot B\left( \frac{p+1}{2}, \frac{q+1}{2} \right) \)

(4). \( B(m, n) = \int_0^\infty \frac{x^{m-1}}{(1 + x)^{m+n}} \, dx \)
GAMMA FUNCTION:

If \( n > 0 \), then Gamma function is denoted by \( \Gamma(n) \) and defined as

\[
\Gamma(n) = \int_{0}^{\infty} e^{-x} x^{n-1} \, dx
\]

PROPERTIES:

1. Reduction formula for Gamma Function \( \Gamma(n + 1) = n\Gamma(n) \); where \( n > 0 \).

2. If \( n \) is a positive integer, then \( \Gamma(n + 1) = n! \)

3. Second Form of Gamma Function

\[
\int_{0}^{\infty} e^{-x^2} x^{2m-1} \, dx = \frac{1}{2} \Gamma(m)
\]

4. Relation Between Beta and Gamma Function,

\[
B(m,n) = \frac{\Gamma(m) \Gamma(n)}{\Gamma(m+n)}.
\]

5. Legendre’s duplication formula

\[
\Gamma(n)\Gamma\left(n + \frac{1}{2}\right) = \frac{\sqrt{\pi}}{2^{2n-1}} \Gamma(2n) \quad \text{OR} \quad \Gamma(n + 1)\Gamma\left(n + \frac{1}{2}\right) = \frac{\sqrt{\pi}}{2^{2n}} \Gamma(2n + 1)
\]

6. Euler’s formula:

\[
\Gamma(n)\Gamma(1-n) = \frac{\pi}{\sin n\pi}; \quad 0 < n < 1
\]

7. Other formulae:

\[
\int_{0}^{\frac{\pi}{2}} \sin^p \theta \cos^q \theta \, d\theta = \frac{1}{2} \frac{\Gamma\left(\frac{p+1}{2}\right) \Gamma\left(\frac{q+1}{2}\right)}{\Gamma\left(\frac{p+q+2}{2}\right)}
\]

\[
\Gamma\left(n + \frac{1}{2}\right) = \frac{(2n)! \sqrt{\pi}}{n! \, 4^n}, \quad \text{for } n = 0,1,2,3,\ldots
\]

Examples: \( \Gamma\left(\frac{1}{2}\right) = \sqrt{\pi} \), \( \Gamma\left(\frac{3}{2}\right) = \frac{\sqrt{\pi}}{2} \), \( \Gamma\left(\frac{5}{2}\right) = \frac{3\sqrt{\pi}}{4} \)
METHOD – 1: EXAMPLES ON SPECIAL FUNCTION

| C  | 1  | Find B(4,3).

| H  | 6  | Find $\Gamma\left(\frac{13}{2}\right)$.  
|    |    | Answer: $\frac{10395\sqrt{\pi}}{64}$ |
| T  | 7  | Find $\Gamma\left(\frac{5}{4}\right)\Gamma\left(\frac{3}{4}\right)$.  
|    |    | Answer: $\frac{\pi}{2\sqrt{2}}$ |

❖ LEGENDRE’S EQUATION:

- An equation of the form $(1 - x^2)y'' - 2xy' + n(n+1)y = 0$ is called Legendre’s Equation, where $n$ is non-negative real constant.

❖ LEGENDRE’S POLYNOMIAL:

- A solution of Legendre’s equation is known as the Legendre’s polynomial which is denoted by $P_n(x)$ and defined as
\[ P_n(x) = \sum_{r=0}^{N} \frac{1}{2^n} \frac{(-1)^r (2n - 2r)! x^{n-2r}}{r! (n-r)! (n-2r)!} \]; Where \( N = \begin{cases} \frac{n}{2} & ; n = \text{even} \\ \frac{n-1}{2} & ; n = \text{odd} \end{cases} \)

**GENERATING FUNCTION OF THE LEGENDRE’S POLYNOMIAL:**

\[ \sum_{n=0}^{\infty} P_n(x)t^n = \frac{1}{\sqrt{1-2xt+t^2}}; |x| < 1, \ |t| < 1 \]

**RODRIGUES’ FORMULA:**

\[ P_n(x) = \frac{1}{2^n n!} \frac{d^n}{dx^n} (x^2 - 1)^n \]

**METHOD – 2: EXAMPLES ON LEGENDRE’S POLYNOMIAL**

**BESSEL’S EQUATION:**

- The linear second order differential equation \( x^2y'' + xy' + (x^2 - n^2)y = 0 \) is called Bessel’s equation, where \( n \) is a non-negative real constant.
- The solutions of Bessel’s equation are called Bessel functions.

**BESSEL’S FUNCTIONS OF THE FIRST KIND**

- The Bessel’s function of the first kind of order \( n \) is denoted by \( J_n(x) \) and defined as
  \[
  J_n(x) = \frac{x^n}{2^n [(n + 1)]} \left[ 1 - \frac{x^2}{2(n + 2)} + \frac{x^4}{2 \cdot 4(2n + 2)(2n + 4)} - \cdots \right]
  \]
  \[
  = \sum_{k=0}^{\infty} \frac{(-1)^k}{k! \Gamma(k + n + 1)} \left( \frac{x}{2} \right)^{2k+n}
  \]

**PROPERTIES**

- \( J_{-n}(x) = (-1)^n J_n(x) \), if \( n \) is a positive integer.
- \( J_{n+1}(x) = \frac{2n}{x} J_n(x) - J_{n-1}(x) \)
- \( \frac{d}{dx} \left( x^n J_n(x) \right) = x^n J_{n-1}(x) \).

UNIT - 6B- SERIES SOLUTION OF DIFFERENTIAL EQUATION

❖ INTRODUCTION:

✓ If homogeneous linear differential equation has constant coefficients, it can be solved by algebraic methods, and its solutions are elementary functions known from calculus (e^x, cos x, etc ...), as we know from unit-4 and 5. However, if such an equation has variable coefficients it must usually be solved by other methods (for example Euler-Cauchy equation).

✓ There are some linear differential equations which do not come in this category. In such cases we have to find a convergent power series arranged according to powers of the independent variable, which will approximately express the value of the dependent variables.

✓ Before actually proceeding to solve linear ordinary differential equations with polynomial coefficient, we will look at some of the basic concepts which require for their study.

❖ POWER SERIES:

✓ An infinite series of the below form is called a power series in (x - x₀).

\[ \sum_{k=0}^{\infty} a_k (x - x_0)^k = a_0 + a_1 (x - x_0) + a_2 (x - x_0)^2 + \cdots \]

❖ ANALYTIC FUNCTION:

✓ A function is said to be analytic at a point x₀ if it can be expressed in a power series near x₀.

❖ ORDINARY POINT & SINGULAR POINT:

✓ If \( P_0(x) \frac{d^2 y}{dx^2} + P_1(x) \frac{dy}{dx} + P_2(x)y = 0 \) be the given differential equation with variable coefficient,

Divide by \( P_0(x) \), \[ \frac{d^2 y}{dx^2} + \frac{P_1(x)}{P_0(x)} \frac{dy}{dx} + \frac{P_2(x)}{P_0(x)}y = 0 \]

\[ \therefore \frac{d^2 y}{dx^2} + P(x) \frac{dy}{dx} + Q(x)y = 0 \ldots \ldots (1) \]

where \( P(x) = \frac{P_1(x)}{P_0(x)} \) & \( Q(x) = \frac{P_2(x)}{P_0(x)} \)
In above equation (1)

- A point \( x_0 \) is called an ordinary point of the differential equation if the functions \( P(x) \) and \( Q(x) \) both are analytic at \( x_0 \).
- If at least one of the functions \( P(x) \) or \( Q(x) \) is not analytic at \( x_0 \) then \( x_0 \) is called a singular point.

**REGULAR SINGULAR POINT AND IRREGULAR SINGULAR POINT:**

- A singular point \( x_0 \) is called regular singular point if both \( (x - x_0)P(x) \) and \( (x - x_0)^2Q(x) \) are analytic at \( x_0 \) otherwise it is called an irregular singular point.

**METHOD – 1: EXAMPLES ON SINGULARITY OF DIFFERENTIAL EQUATION**

| C | 1 | Find singularity of \( y'' + (x^2 + 1)y' + (x^3 + 2x^2 + 3x)y = 0 \). | \textbf{Answer: No singular point} |
| H | 2 | Find singularity of \( y'' + e^xy' + \sin(x^2)y = 0 \). | \textbf{Answer: No singular point} |
| H | 3 | Classify ordinary points, singular points, regular-singular points and irregular-singular points (if exist) of the differential equation \( y'' + xy' = 0 \). | \textbf{Answer: Set of ordianry point} \( = \mathbb{R} \). There is no singular point. |
| H | 4 | Classify ordinary points, singular points, regular-singular points and irregular-singular points (if exist) of the differential equation \( xy'' + y' = 0 \). | \textbf{Answer: Set of ordianry point} \( = \mathbb{R} - \{0\} \). \( x = 0 \) is a singular and also Regular singular point. |
| C | 5 | Find singularity of \( x^3y'' + 5xy' + 3y = 0 \). | \textbf{Answer:} \( x = 0 \) \textbf{is an Irregular Singular Point.} |
| H | 6 | Find singularity of \( (1 - x^2)y'' - 2xy' + n(n + 1)y = 0 \). | \textbf{Answer:} \( x = 1 \) \& \(-1 \) \textbf{are Regular Singular Points.} |
| H | 7 | Find singularity of \( x^3(x - 1)y'' + 3(x - 1)y' + 7xy = 0 \). | \textbf{Answer:} \( x = 1 \) is a Regular Singular Point \& \( x = 0 \) is an Irregular Singular Point. |
| T | 8 | Find singularity of \( (x^2 + 1)y'' + xy' - xy = 0 \).
   \[ \text{Answer: } x = i, -i \text{ are Regular Singular Points.} \] |
|---|---|---|
| C | 9 | Find singularity of \( 2x(x - 2)^2y'' + 3xy' + (x - 2)y = 0 \).
   \[ \text{Answer: } x = 0 \text{ is a Regular Singular Point & } x = 2 \text{ is an Irregular Singular Point.} \] |
| H | 10 | Find singularity of \( x(x + 1)^2y'' + (2x - 1)y' + x^2y = 0 \).
   \[ \text{Answer: } x = 0 \text{ is a Regular Singular Point & } x = -1 \text{ is an Irregular Singular Point} \] |
| T | 11 | \( x = 0 \) is a regular singular point of \( 2x^2y'' + 3xy' + (x^2 - 4)y = 0 \) say true or false.
   \[ \text{Answer: True} \] |
| H | 12 | Classify the singular points of the equation \( x^3(x - 2)y'' + x^3y' + 6y = 0 \)
   \[ \text{Answer: } x = 0 \text{ is an Irregular Singular Point & } x = 2 \text{ is a Regular Singular Point.} \] |

**POWER SERIES SOLUTION:**

- A series solution of the below differential equation at an ordinary point is called power series solution.

\[
P_0(x) \frac{d^2y}{dx^2} + P_1(x) \frac{dy}{dx} + P_2(x)y = 0
\]

**PROCEDURE FOR FINDING SERIES SOLUTION BY POWER SERIES METHOD:**

- A power series solution of a differential equation

\[
P_0(x) \frac{d^2y}{dx^2} + P_1(x) \frac{dy}{dx} + P_2(x)y = 0
\]

at an ordinary point \( x_0 = 0 \) can be obtained using the following steps.

- **Step-1:** Assume that below \( y \) is the solution of the given differential equation.

\[
y = \sum_{k=0}^{\infty} a_k (x - x_0)^k = a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + \cdots
\]

- **Step-2:** Differentiating \( y \) with respect to \( x \) we get,
\[ y' = \frac{dy}{dx} = a_1 + 2a_2 x + 3a_3 x^2 + 4a_4 x^3 + 5a_5 x^4 + \ldots \]

\[ y'' = \frac{d^2 y}{dx^2} = 2a_2 + 6a_3 x + 12a_4 x^2 + 20a_5 x^3 + \ldots \]

**Step-3:** Substitute the expressions of \( y, y' \), and \( y'' \) in the given differential equation.

**Step-4:** Equate to zero the co-efficient of various powers of \( x \) and find \( a_2, a_3, a_4 \ldots \) etc in terms of \( a_0 \) and \( a_1 \).

**Step-5:** Substitute the expressions of \( a_2, a_3, a_4, \ldots \) in \( y = a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + \ldots \) which is required solution.

**METHOD – 2: EXAMPLES ON POWER SERIES METHOD**

<p>| H | 1 | ( y' + 2xy = 0 ). | Answer: ( a_0 - a_0 x^2 + \frac{1}{2} a_0 x^4 - \frac{1}{6} a_0 x^6 + \ldots ) |

**Answer:** \( a_0 + a_1 x - a_0 \ x^2 - \frac{a_0}{3} \ x^4 + \ldots \)  

**FROBENIUS METHOD**

Procedure for finding series solution by Frobenius method:

✓ A power series solution of a differential equation
\[ p_0(x) \frac{d^2y}{dx^2} + p_1(x) \frac{dy}{dx} + p_2(x)y = 0 \]

at a regular-singular point \( x_0 \) can be obtained by using the following steps.

✓ **Step-1:** Assume that

\[ y = \sum_{n=0}^{\infty} a_n (x - x_0)^{n+k} \]

\[ = (x - x_0)^k \left[ a_0 + a_1(x - x_0) + a_2(x - x_0)^2 + \cdots \right] \]

is the solution of the given differential equation.

✓ **Step-2:** Differentiating \( y \) with respect to \( x \) twice we get,

\[ \Rightarrow y' = \frac{dy}{dx} = \sum_{n=0}^{\infty} (n + k)a_n(x - x_0)^{n+k-1} \]

\[ \Rightarrow y'' = \frac{d^2y}{dx^2} = \sum_{n=0}^{\infty} (n + k)(n + k - 1)a_n(x - x_0)^{n+k-2} \]

✓ **Step-3:** Substitute the expressions of \( y, y', \) and \( y'' \) in the given differential equation.

✓ **Step-4:** Equating to zero the coefficients of the lowest degree term in \((x - x_0)\), we obtained a quadratic equation in \( k \), called the Indicial Equation of the given differential equation. The roots of the indicial equation are known as Indicial Roots.

✓ **Step-5:** Using the recurrence relation for each indicial root separately, two linearly independent solutions \( y_1(x) \) and \( y_2(x) \) of the given D.E. are obtained.

Therefore, the general solution of the given D.E. is

\[ y(x) = C_1 y_1(x) + C_2 y_2(x) \]

Where, \( C_1 \) and \( C_2 \) are arbitrary constants.

✓ Now, one of the solutions \( y_1(x) \) or \( y_2(x) \) is in the form of equation (1).

✓ The form of the other solution depends upon the nature of the indicial roots. There are three cases:

**Case-1:** \( k_1 - k_2 \neq \text{Integer} \)

Then \( y_1 = (y)_{k=k_1} \) & \( y_2 = (y)_{k=k_2} \)

The general solution is: \( y = C_1 y_1 + C_2 y_2 \)
**Case-2:** Repeated Roots i.e. When $k_1 = k_2 = t$ (say)

Then $y_1 = (y)_{k=t} \quad \text{&} \quad y_2 = \left( \frac{\partial y}{\partial k} \right)_{k=t}$

The general solution is: $y = C_1(y)_{k=t} + C_2 \left( \frac{\partial y}{\partial k} \right)_{k=t}$

**Case-3:** $k_1 - k_2$ differs by an integer i.e. $k_1 - k_2 = \text{Integer}$ and $k_1 < k_2$

In this case, solution corresponding to $k_1$ and $k_2$ may or may not be L.I. This leads to two possibilities:

(a) One of the coefficient becomes $\infty$ for smaller indicial root $k = k_1$

- The procedure is modified by putting $a_0 = C_0(k - k_1), C_0 \neq 0$

Then, $y_1 = (y)_{k=k_1}, \quad y_2 = \left( \frac{\partial y}{\partial k} \right)_{k=k_1}$

The solution corresponding to second root $k_2$ is usually multiple of $y_1$ or a part of $\left( \frac{\partial y}{\partial k} \right)_{k=k_1}$

Hence, it produces L.D. solution.

The general solution is: $y = C_1(y)_{k=k_1} + C_2 \left( \frac{\partial y}{\partial k} \right)_{k=k_1}$

(b) One of the coefficient becomes indeterminate for smaller indicial root $k = k_1$.

- This root produces the complete solution as it contains two arbitrary constants.

The second indicial root $k_2$ produces L.D. solution.

01 | Vector Calculus: Parametrization of curves, Arc length of curve in space, Line Integrals, Vector fields and applications as Work, Circulation and Flux, Path independence, potential function, piecewise smooth, connected domain, simply connected domain, fundamental theorem of line integrals, Conservative fields, component test for conservative fields, exact differential forms, Div, Curl, Green’s theorem in the plane (without proof). | 9 | 20 |
02 | Laplace Transform and inverse Laplace transform, Linearity, First Shifting Theorem (s-Shifting), Transforms of Derivatives and Integrals, ODEs, Unit Step Function (Heaviside Function), Second Shifting Theorem (t-Shifting), Laplace transform of periodic functions, Short Impulses, Dirac’s Delta Function, Convolution, Integral Equations, Differentiation and Integration of Transforms, ODEs with Variable Coefficients, Systems of ODEs. | 7 | 20 |
03 | Fourier Integral, Fourier Cosine Integral and Fourier Sine Integral. | 02 |
04 | First order ordinary differential equations, Exact, linear and Bernoulli’s equations, Equations not of first degree: equations solvable for p, equations solvable for y, equations solvable for x and Clairaut’s type. | 6 | 14 |
05 | Ordinary differential equations of higher orders, Homogeneous Linear ODEs of Higher Order, Homogeneous Linear ODEs with Constant Coefficients, Euler–Cauchy Equations, Existence and Uniqueness of Solutions, Linear Dependence and Independence of Solutions, Wronskian, Nonhomogeneous ODEs, Method of Undetermined Coefficients, Solution by Variation of Parameters. | 10 | 26 |
06 | Series Solutions of ODEs, Special Functions, Power Series Method, Legendre’s Equation, Legendre Polynomials, Frobenius Method, Bessel’s Equation, Bessel functions of the first kind and their properties. | 8 | 20 |
Reference Books:

Course Outcomes:

The objective of this course is to familiarize the prospective engineers with techniques in vector calculus, ordinary differential equations, fourier integrals and laplace transform. It aims to equip the students to deal with advanced level of mathematics and applications that would be essential for their disciplines.

GUJARAT TECHNOLOGICAL UNIVERSITY
BE - SEMESTER–I &II (NEW) EXAMINATION – SUMMER-2019

Subject Code: 3110015 \hspace{1cm} Date: 01/06/2019
Subject Name: Mathematics –2
Time: 10:30 AM TO 01:30 PM \hspace{1cm} Total Marks: 70

Instructions:
1. Attempt all questions.
2. Make suitable assumptions wherever necessary.
3. Figures to the right indicate full marks.

**Unit-1**

**Q.1**

(a) Evaluate \( \oint_C \vec{F} \cdot d\vec{r} \); where \( \vec{F} = (x^2 - y^2) \hat{i} + 2xy \hat{j} \) and \( C \) is the curve given by the parametric equation \( C : r(t) = t^2 \hat{i} + t \hat{j} \); \( 0 \leq t \leq 2 \).

(b) Apply Green’s theorem to find the outward flux of a vector field \( \vec{F} = \frac{1}{xy} (x \hat{i} + y \hat{j}) \) across the curve bounded by \( y = \sqrt{x}, 2y = 1 \) and \( x = 1 \).

(c) Integrate \( f(x,y,z) = x - yz^2 \) over the curve \( C = C_1 + C_2 \), where \( C_1 \) is the line segment joining \((0,0,1)\) to \((1,1,0)\) and \( C_2 \) is the curve \( y=x^2 \) joining \((1,1,0)\) to \((2,4,0)\).

**OR**

(c) Check whether the vector field \( \vec{F} = e^{y+2z} \hat{i} + x e^{y+2z} \hat{j} + 2x e^{y+2z} \hat{k} \) is conservative or not. If yes, find the scalar potential function \( \varphi (x,y,z) \) such that \( \vec{F} = \nabla \varphi \).

**Unit-2**

**Q.2**

(a) Find the Fourier integral representation of
\[ f(x) = \begin{cases} x & x \in (0, a) \\ 0 & x \in (a, \infty) \end{cases} \]

(b) Define: Unit step function. Use it to find the Laplace transform of
\[ f(t) = \begin{cases} (t - 1)^2 & t \in (0, 1) \\ 1 & t \in (1, \infty) \end{cases} \]

(c) Use the method of undetermined coefficients to solve the differential equation \( y'' - 2y' + y = x^2 e^x \).

**Unit-3**

**Q.3**

(a) Write a necessary and sufficient condition for the differential equation
\[ M(x,y)dx + N(x,y)dy = 0 \]

(b) Solve the differential equation
\[ (1 + y^2)dx = (e^{-\tan^{-1} y} - x)dy \]

(c) By using Laplace transform solve a system of differential equations
\[
\frac{dx}{dt} = 1 - y, \quad \frac{dy}{dt} = -x, \quad \text{where} \quad x(0) = 1, y(0) = 0.
\]

**OR**

(c) Solve the differential equation
\[ (2x^2 + 4y)dx - xdy = 0. \]
(b) Solve: \((x + 1) \frac{dy}{dx} - y = e^{3x}(x + 1)^2\).

(c) By using Laplace transform solve a differential equation \(\frac{d^2y}{dt^2} + 5 \frac{dy}{dt} + 6y = e^{-t}\), where \(y(0) = 0\), \(y'(0) = -1\).

Q.4 (a) Find the general solution of the differential equation
\[ e^{-y} \frac{dy}{dx} + \frac{e^{-y}}{x} = \frac{1}{x^2} \]

(b) Solve: \(\frac{d^3y}{dx^3} - 7 \frac{dy}{dx} + 6y = e^x\)

(c) Find a power series solution of the differential equation \(y'' - xy = 0\) near an ordinary point \(x=0\).

OR

Q.4 (a) Find the general solution of the differential equation
\(\frac{dy}{dx} + \frac{y}{x} - \sqrt{y} = 0\).

(b) Solve: \(x^3 \frac{d^3y}{dx^3} + 2x^2 \frac{d^2y}{dx^2} + 2y = x\)

(c) Find a Frobenius series solution of the differential equation \(2x^2y'' + xy' - (x + 1)y = 0\) near a regular-singular point \(x=0\).

Q.5 (a) Write Legendre’s polynomial \(P_n(x)\) of degree-\(n\) and hence obtain \(P_1(x)\) and \(P_2(x)\) in powers of \(x\).

(b) Classify ordinary points, singular points, regular-singular points and irregular-singular points (if exist) of the differential equation \(y'' + xy' = 0\).

(c) Solve the differential equation
\[ x^2 \frac{d^2y}{dx^2} - 2x \frac{dy}{dx} + 2y = x^3 \cos x \]
by using the method of variation of parameters.

OR

Q.5 (a) Write Bessel’s function \(J_p(x)\) of the first kind of order-\(p\) and hence show that \(J_{1/2}(x) = \sqrt{\frac{2}{\pi x}} \sin x\).

(b) Classify ordinary points, singular points, regular-singular points and irregular-singular points (if exist) of the differential equation \(xy'' + y' = 0\).

(c) Solve the differential equation \(y'' + 25y = \sec 5x\) by using the method of variation of parameters.
GUJARAT TECHNOLOGICAL UNIVERSITY
BE - SEMESTER- I & II (NEW) EXAMINATION – WINTER 2019

Subject Code: 3110015
Subject Name: Mathematics –2

Instructions:
1. Attempt all questions.
2. Make suitable assumptions wherever necessary.
3. Figures to the right indicate full marks.

Unit-1

Q.1
(a) Find the length of curve of the portion of the circular helix
\[ \mathbf{r}(t) = \cos t \mathbf{i} + \sin t \mathbf{j} + t \mathbf{k} \] from \( t = 0 \) to \( t = \pi \)

(b) \( \int_{(1,2)}^{(3,4)} (xy^2 + y^3) \, dx + (x^2 y + 3xy^2) \, dy \) is independent of path joining the points (1, 2) and (3,4). Hence, evaluate the integral.

(c) Verify tangential form of Green’s theorem for \( \mathbf{F} = (x - \sin y) \mathbf{i} + (\cos y) \mathbf{j} \), where C is the boundary of the region bounded by the lines \( y = 0, x = \pi/2 \) and \( y = x \).

Unit-2

Q.2
(a) Find the Laplace transform of \( f(t) \) defined as
\[ f(t) = \begin{cases} \frac{t}{k} & 0 < t < k \\ 1 & t > k \end{cases} \]

(b) Find the inverse Laplace transform of \( \frac{s^2}{(s^2 + a^2)(s^2 + b^2)} \)

(c) (i) Calculate the curl of the vector \( xyz \mathbf{i} + 3x^2 y \mathbf{j} + (xz^2 - y^2 z) \mathbf{k} \)

(ii) The temperature at any point in space is given by \( T = xy + yz + zx \). Determine the derivative of \( T \) in the direction of the vector \( 3\mathbf{i} - 4\mathbf{k} \) at the point (1, 1, 1).

Unit-1

Q.3
(a) Find constants \( a, b \) and \( c \) such that \( \mathbf{V} = (x + 2y + az) \mathbf{i} + (bx - 3y - z) \mathbf{j} + (4x + cy + 2z) \mathbf{k} \) is irrotational.

Unit-3

(b) Using Fourier cosine integral representation show that
\[ \int_0^{\pi} \frac{\cos \omega x}{\omega^2 + k^2} \, d\omega = \frac{\pi e^{-kx}}{2k} \]

Unit-4

(c) Solve the following differential equations:
(i) \( \cos (x + y) \, dy = dx \)
(ii) \( \sec^2 y \, \frac{dy}{dx} + x \tan y = x^3 \)

OR
Q.3 (a) Find the Laplace transform of (i) \( \int_0^t \frac{\sin t}{t} \, dt \) (ii) \( t^2 u(t - 3) \)

(b) Using Convolution theorem obtain \( L^1 \left( \frac{1}{s(s^2 + a^2)} \right) \)

(c) Find the power series solution of \( \frac{d^2 y}{dx^2} + xy = 0 \)

Q.4 (a) Find the Laplace transform of the waveform 

\[ f(t) = \left( \frac{2t}{3} \right), \quad 0 \leq t \leq 3 \]

(b) Using the Laplace transforms, find the solution of the initial value problem 

\[ y'' + 25y = 10 \cos 5t \quad y(0) = 2, \quad y'(0) = 0 \]

(c) Using variation of parameter method solve \((D^2 + 1)y = x \sin x\)

OR

Q.4 (a) Solve \( y' \frac{dy}{dx} + \left( \frac{dy}{dx} \right)^2 = \frac{dy}{dx} \)

(b) Solve \( y'' - 3y'' + 3y' - y = 4e^t \)

(c) Solve \( \frac{d^2 y}{dx^2} + 2 \frac{dy}{dx} + 4y = 2x^2 + 3e^{-x} \) using method of undetermined coefficients.

Q.5 (a) Classify the singular points of the equation \( x^3 (x - 2) y'' + x^3 y' + 6y = 0 \)

(b) Solve \((D^2 + 4)y = \cos 2x\)

(c) Solve \( ye^x dx + (2y + e^x) dy = 0\) (ii) \( \frac{dy}{dx} + 2y \tan x = \sin x\)

OR

Q.5 (a) Solve \( \frac{dy}{dx} = \frac{y^3}{e^{2x} + y^2} \)

(b) If \( y_1 = x \) is one of solution of \( x^2 y'' + xy' - y = 0 \) find the second solution.

(c) Using Frobenius method solve \( x^2 y'' + 4xy' + \left( x^2 + 2 \right)y = 0 \)

***********
